Examples of Solved Problems in Fluid Flow

To illustrate the types of challenges encountered in fluid flow, here are some specific examples from the 1000 solved problems in fluid flow collection:

Example 1: Hydrostatic Pressure Calculation

Problem: Calculate the hydrostatic pressure at a depth of 10 meters in a freshwater lake.

Solution:
- Use the formula:
$P = \rho g h$
where:
P = hydrostatic pressure (Pa)
ρ = density of water (1000 kg/m³)
g = acceleration due to gravity (9.81 m/s²)
h = depth (10 m)

- Calculation:
$P = 1000 \times 9.81 \times 10 = 98100 \, \text{Pa}$

Answer: The hydrostatic pressure at a depth of 10 meters is 98,100 Pa.

Example 2: Flow Rate in a Pipe

Problem: A pipe of diameter 0.1 m carries water at a velocity of 3 m/s. Calculate the flow rate.

Solution:
- Use the formula:
$$ Q = A \cdot v $$
where:
$ Q $ = flow rate (m^3/s)
$ A $ = cross-sectional area (m^2)
$ v $ = velocity (m/s)

- Cross-sectional area calculation:
$$ A = \frac{\pi d^2}{4} = \frac{\pi (0.1)^2}{4} = 0.00785 \, \text{m}^2 $$

- Flow rate:
$$ Q = 0.00785 \times 3 = 0.02355 \, \text{m}^3/\text{s} $$

Answer: The flow rate in the pipe is 0.02355 m^3/s.

Example 3: Turbulent Flow in a Pipe

Problem: Calculate the head loss due to friction in a 100-meter long pipe with a diameter of 0.05 m carrying water at a velocity of 2 m/s. Assume the Darcy friction factor is 0.02.

Solution:
- Use the Darcy-Weisbach equation:
$$ h_f = f \cdot \frac{L}{D} \cdot \frac{v^2}{2g} $$
where:
$ h_f $ = head loss (m)
$ f $ = Darcy friction factor
$ L $ = length of the pipe (m)
$ D $ = diameter of the pipe (m)
$ v $ = velocity (m/s)
$ g $ = acceleration due to gravity ($9.81 m/s^2$)

- Calculation:
$$ h_f = 0.02 \cdot \frac{100}{0.05} \cdot \frac{(2)^2}{2 \times 9.81} $$
$$ h_f = 0.02 \cdot 2000 \cdot \frac{4}{19.62} $$
$$ h_f = 0.02 \cdot 2000 \cdot 0.2037 $$
$$ h_f = 8.148 \, \text{m} $$

Answer: The head loss due to friction in the pipe is approximately 8.15 m.
