

# 5th Grade Math Vocabulary Words

# MATH

## VOCABULARY

OPERATIONS & ALGEBRAIC THINKING	NUMBERS & OPERATIONS •base ten•	NUMBERS & OPERATIONS •fractions•	MEASUREMENT & DATA	GEOMETRY
<b>ORDER OF OPERATION</b> <b>PEMDAS</b> <b>FUNCTION TABLE</b> <b>PARENTHESES</b>	<b>AREA MODEL</b> <b>NUMBER NAMES</b> <b>COMMUTATIVE PROPERTY</b> <b>NUMERICAL EXPRESSION</b> <b>DIVIDEND</b>	<b>FRACTION</b> <b>DECIMAL FRACTION</b> <b>MIXED NUMBER</b> <b>EQUIVALENT FRACTIONS</b>	<b>DATA</b> <b>CUSTOMARY SYSTEM</b> <b>METER</b> <b>LINE PLOT</b> <b>AREA</b>	<b>RECTANGULAR PRISM</b> <b>RIGHT TRIANGLE</b> <b>BASE OF SOLID</b>

## 102 COMMON CORE ALIGNED WORDS

<b>PLACE VALUE</b> In the base ten system, where a digit is located. <b>THE PLACE OF THE 7 IN 375 IS TENS</b>	<b>DECIMAL FRACTION</b> A fractional number with a denominator of 10 or a power of 10. $.32 = \frac{32}{100}$	<b>estimate</b> About how much or how many, close to the exact amount. <b>1,879 IS ABOUT 2,000</b>
<b>ROUND A NUMBER</b> To find the nearest ten, hundred, thousand, etc. <b>1,325 rounded to the nearest TEN would be 1,330</b>	<b>X COORDINATE</b> In an ordered pair, the value that is always written first (how many left or right). <b>(3,5)</b>	<b>BASE OF AN EXPONENT</b> The number that is raised to a power. <b>9<sup>2</sup></b>
<b>ORDER OF OPERATION</b> A set of rules that tells the order in which to complete. <b>PEMDAS</b>	<b>AREA MODEL</b> A model of multiplication that shows each place value product within a rectangle arranged. $7 \times 36 = 252$ $7 \times 30 = 210$ $7 \times 6 = 42$	<b>DECIMAL</b> A number with one or more digits to the right of a decimal point. <b>7.83</b>
<b>ASSOCIATIVE PROPERTY</b> Changing the grouping of 3 or more factors does not change the product. $(1 \times 2) \times 3 = 1 \times (2 \times 3)$	<b>EQUATION</b> A number sentence with equal amounts on either side of the equal sign. $4 + 2 = 6$	<b>EVALUATE</b> To find the value of a mathematical expression. $9 \times n = 36$ $n = 4$
<b>DISTRIBUTIVE PROPERTY</b> Multiply a sum by multiplying each addend separately then add the products. $A \times (B + C) = (A \times B) + (A \times C)$	<b>REMAINDER</b> What is left over after you divide. $53 \div 4 = 12 \text{ R } 1$	<b>INEQUALITY</b> A mathematical sentence that compares two unequal expressions using the symbols <, >, or =. $(3 \times 2) > (4 - 3)$
<b>IDENTITY PROPERTY</b> Any number multiplied by one is that number. $4 \times 1 = 4$	<b>DIVIDEND</b> The number you are dividing. $42 \div 6 = 7$	<b>PRODUCT</b> To get the product, we must multiply. $5 \times 6 = 30$

5th grade math vocabulary words are essential for students to understand the concepts and processes involved in mathematics. Mastering these terms not

only enhances their comprehension but also improves their ability to communicate mathematical ideas effectively. As students progress through their education, a solid grasp of math vocabulary becomes increasingly crucial. This article will explore significant math vocabulary words for 5th graders, categorize them into different sections, and provide definitions and examples to help students and educators alike.

## Understanding Basic Operations

Mathematics begins with the foundational operations: addition, subtraction, multiplication, and division. Here are some important vocabulary words related to these basic operations:

### 1. Addition

- Sum: The result of adding two or more numbers together.
- Example: The sum of 3 and 5 is 8.
- Addend: Any number that is added to another number.
- Example: In the equation  $4 + 6$ , both 4 and 6 are addends.
- Plus: A term used to indicate addition.
- Example: 7 plus 2 equals 9.

### 2. Subtraction

- Difference: The result of subtracting one number from another.
- Example: The difference between 10 and 4 is 6.
- Minuend: The number from which another number (the subtrahend) is subtracted.
- Example: In the equation  $9 - 3$ , 9 is the minuend.
- Subtrahend: The number that is subtracted from the minuend.
- Example: In  $7 - 2$ , 2 is the subtrahend.

### 3. Multiplication

- Product: The result of multiplying two or more numbers.
- Example: The product of 4 and 5 is 20.
- Factor: Any number that is multiplied by another number.
- Example: In the equation  $2 \times 6$ , both 2 and 6 are factors.
- Times: A term used to indicate multiplication.
- Example: 3 times 4 equals 12.

### 4. Division

- Quotient: The result of dividing one number by another.
- Example: The quotient of 20 and 4 is 5.
- Dividend: The number that is being divided.
- Example: In the equation  $15 \div 3$ , 15 is the dividend.
- Divisor: The number by which the dividend is divided.

- Example: In  $18 \div 6$ , 6 is the divisor.

## Working with Fractions

Fractions are a critical part of 5th-grade math, and understanding their vocabulary is essential for success.

### 1. Basic Terms

- Fraction: A number that represents a part of a whole.
- Example:  $\frac{1}{2}$  is a fraction that indicates one part out of two equal parts.
- Numerator: The top number in a fraction, representing how many parts are being considered.
- Example: In the fraction  $\frac{3}{4}$ , 3 is the numerator.
- Denominator: The bottom number in a fraction, representing the total number of equal parts.
- Example: In the fraction  $\frac{5}{8}$ , 8 is the denominator.

### 2. Types of Fractions

- Proper Fraction: A fraction where the numerator is less than the denominator.
- Example:  $\frac{2}{3}$  is a proper fraction.
- Improper Fraction: A fraction where the numerator is greater than or equal to the denominator.
- Example:  $\frac{7}{4}$  is an improper fraction.
- Mixed Number: A number that combines a whole number and a proper fraction.
- Example:  $2 \frac{1}{2}$  is a mixed number.

### 3. Operations with Fractions

- Common Denominator: A shared multiple of the denominators of two or more fractions.
- Example: The common denominator of  $\frac{1}{4}$  and  $\frac{1}{6}$  is 12.
- Equivalent Fractions: Different fractions that represent the same value.
- Example:  $\frac{1}{2}$  and  $\frac{2}{4}$  are equivalent fractions.

## Exploring Decimals

Decimals are another important area of 5th-grade math, and understanding their vocabulary is key to working with them effectively.

### 1. Basic Decimal Terms

- Decimal: A fraction expressed in a special form, using a decimal point.
- Example: 0.75 is a decimal that represents three-quarters.

- Place Value: The value of a digit based on its position in a number.
- Example: In the number 3.14, the 1 is in the tenths place and the 4 is in the hundredths place.

## 2. Operations with Decimals

- Round: To reduce the number of digits in a number while keeping its value close to what it was.
- Example: Rounding 3.76 to the nearest whole number gives you 4.
- Estimate: To find a number that is close to an exact amount.
- Example: Estimating  $4.8 + 3.2$  gives approximately 8.

## Understanding Geometry

Geometry is a significant component of 5th-grade math, and vocabulary associated with shapes and measurements is essential.

### 1. Basic Shapes

- Polygon: A closed figure with straight sides.
- Example: A triangle and a square are both polygons.
- Quadrilateral: A polygon with four sides.
- Example: A rectangle is a type of quadrilateral.
- Circle: A round shape with all points equidistant from the center.
- Example: A hula hoop is shaped like a circle.

### 2. Properties of Shapes

- Angle: A figure formed by two rays (sides) that share a common endpoint (the vertex).
- Example: A right angle measures 90 degrees.
- Perimeter: The total distance around a shape.
- Example: The perimeter of a rectangle is calculated by adding the lengths of all four sides.
- Area: The amount of space inside a shape.
- Example: The area of a rectangle can be calculated by multiplying the length by the width.

### 3. Solid Figures

- Volume: The amount of space occupied by a solid figure.
- Example: The volume of a cube is found by cubing the length of one side.
- Sphere: A three-dimensional round shape where every point on the surface is the same distance from the center.
- Example: A basketball is shaped like a sphere.

# Data and Measurement Vocabulary

Data and measurement are also crucial components of the 5th-grade math curriculum. Understanding the vocabulary associated with these areas can aid students in interpreting and presenting data effectively.

## 1. Data Vocabulary

- Statistics: The study of collecting, analyzing, interpreting, and presenting data.
- Example: Analyzing test scores is an example of statistics.
- Mean: The average of a set of numbers calculated by dividing the sum by the number of values.
- Example: The mean of 4, 8, and 12 is 8.
- Median: The middle number in a set of data when arranged in order.
- Example: In the set {3, 5, 7}, the median is 5.

## 2. Measurement Vocabulary

- Unit: A standard quantity used to measure.
- Example: Common units include meters for length and liters for volume.
- Inch: A unit of measurement that is equal to  $\frac{1}{12}$  of a foot.
- Example: A ruler usually has inches marked along its length.
- Centimeter: A metric unit of length equal to  $\frac{1}{100}$  of a meter.
- Example: A centimeter is about the width of a large paperclip.

## Conclusion

Mastering 5th grade math vocabulary words is crucial for students as they navigate through increasingly complex mathematical concepts. By familiarizing themselves with the terms associated with basic operations, fractions, decimals, geometry, and data measurement, they lay a solid foundation for future learning. Educators can support this process by integrating these vocabulary words into lessons, using them in context, and encouraging students to use them in their mathematical reasoning. Understanding and using math vocabulary not only enhances comprehension but also builds confidence in students as they engage with mathematics in their everyday lives. As they continue their journey through mathematics, these vocabulary words will serve as essential tools for their academic success.

## Frequently Asked Questions

### What is the definition of 'numerator' in mathematics?

The numerator is the top number in a fraction that represents how many parts of the whole are being considered.

### **What does 'denominator' mean?**

The denominator is the bottom number in a fraction that indicates into how many equal parts the whole is divided.

### **Can you explain what 'perimeter' means?**

Perimeter is the total distance around the outside of a polygon, calculated by adding the lengths of all its sides.

### **What is 'area' in the context of geometry?**

Area is the amount of space inside a two-dimensional shape, measured in square units, such as square inches or square meters.

### **What does 'mean' refer to in statistics?**

The mean is the average of a set of numbers, calculated by adding all the numbers together and dividing by the count of numbers.

### **What is a 'quadrilateral'?**

A quadrilateral is a four-sided polygon, which can include shapes like squares, rectangles, and trapezoids.

### **What does it mean to 'multiply' in math?**

To multiply means to combine equal groups to find the total, typically represented by the '×' symbol.

### **What is the definition of 'divisor'?**

A divisor is a number by which another number is divided, resulting in a quotient.

### **What does 'estimation' mean in mathematics?**

Estimation is the process of finding a number that is close enough to the right answer, often used to simplify calculations.
