

7 3 Practice Rational Exponents Answers

NAME _____ DATE _____ PERIOD _____

7-3 Skills Practice Rational Exponents

Write each expression in radical form, or write each radical in exponential form.

1. $(8x)^{\frac{1}{2}}$ $\sqrt{8x}$

2. $6x^{\frac{1}{2}}$ $6\sqrt{x}$

3. $\sqrt[3]{19}$ $19^{\frac{1}{3}}$

4. $\sqrt[3]{11}$ $11^{\frac{1}{3}}$

5. $19x^{\frac{1}{2}}$ $19\sqrt{x}$

6. $\sqrt[3]{34}$ $34^{\frac{1}{3}}$

7. $\sqrt[3]{27g}$ $(27g)^{\frac{1}{3}}$

8. $33gh^{\frac{1}{2}}$ $33g\sqrt{h}$

9. $\sqrt[3]{13abc}$ $(13abc)^{\frac{1}{3}}$

Simplify.

10. $\left(\frac{1}{16}\right)^{\frac{3}{4}}$ $\frac{1}{2}$

11. $\sqrt[3]{3125}$ 5

12. $729^{\frac{1}{3}}$ 9

13. $\left(\frac{1}{32}\right)^{\frac{5}{5}}$ $\frac{1}{2}$

14. $\sqrt[4]{4096}$ 4

15. $1024^{\frac{1}{4}}$ 4

16. $\left(\frac{16}{625}\right)^{\frac{1}{4}}$ $\frac{2}{5}$

17. $\sqrt[5]{15,625}$ 5

18. $117,649^{\frac{1}{6}}$ 7

Solve each equation.

19. $2^x = 512$ 9

20. $3^x = 6561$ 8

21. $6^x = 46,656$ 6

22. $5^x = 125$ 3

23. $3^{x-3} = 243$ 8

24. $4^{x-1} = 1024$ 6

25. $6^{x-1} = 1296$ 5

26. $2^{4x+3} = 2048$ 2

27. $3^{3x+3} = 6561$ $\frac{5}{3}$

7 3 practice rational exponents answers are essential for students and learners who want to master the concept of rational exponents in mathematics. Rational exponents are a critical component of algebra and are used extensively in various mathematical applications. Understanding how to work with them can not only improve your skills in algebra but also enhance your overall mathematical reasoning. In this article, we will explore the basics of rational exponents, provide practice problems, and ultimately present the answers to help solidify your understanding.

Understanding Rational Exponents

Rational exponents are expressions that can be expressed as a fraction. They are a convenient way to represent roots and powers. The general form of a rational exponent is:

$$a^{\frac{m}{n}} = \sqrt[n]{a^m}$$

Where:

- a is the base,
- m is the numerator (which indicates the power),
- n is the denominator (which indicates the root).

For example, $8^{\frac{2}{3}}$ can be interpreted as the cube root of 8 squared. Understanding this concept is crucial for solving problems involving rational exponents.

Common Properties of Rational Exponents

Before diving into practice problems, it's vital to familiarize yourself with the essential properties of rational exponents:

- **Product of Powers:** $a^m \cdot a^n = a^{m+n}$
- **Quotient of Powers:** $\frac{a^m}{a^n} = a^{m-n}$
- **Power of a Power:** $(a^m)^n = a^{m \cdot n}$
- **Power of a Product:** $(ab)^n = a^n \cdot b^n$
- **Power of a Quotient:** $\left(\frac{a}{b}\right)^n = \frac{a^n}{b^n}$

Practice Problems for Rational Exponents

To gain a better understanding of rational exponents, try solving the following practice problems. The answers will be provided later in this article.

1. Evaluate: $27^{\frac{2}{3}}$

2. Evaluate: $\left(16^{\frac{3}{4}} \right)$

3. Evaluate: $\left(64^{\frac{1}{2}} \cdot 8^{\frac{2}{3}} \right)$

4. Evaluate: $\left(\left(81^{\frac{1}{4}} \right)^2 \right)$

5. Evaluate: $\left(\frac{125^{\frac{3}{2}}}{25^{\frac{1}{2}}} \right)$

6. Evaluate: $\left(32^{\frac{5}{5}} \cdot 4^{\frac{1}{2}} \right)$

7. Evaluate: $\left(\left(9^{\frac{1}{2}} \cdot 27^{\frac{2}{3}} \right) \right)$

Answers to 7 3 Practice Rational Exponents

Now that you have attempted the practice problems, let's go through the solutions step by step.

1. Evaluate: $\left(27^{\frac{2}{3}} \right)$

To solve this, we recognize that $\left(27 = 3^3 \right)$. Therefore:

$$\left[27^{\frac{2}{3}} = (3^3)^{\frac{2}{3}} = 3^{3 \cdot \frac{2}{3}} = 3^2 = 9 \right]$$

2. Evaluate: $\left(16^{\frac{3}{4}} \right)$

Since $\left(16 = 2^4 \right)$, we can rewrite it as:

$$\left[16^{\frac{3}{4}} = (2^4)^{\frac{3}{4}} = 2^{4 \cdot \frac{3}{4}} = 2^3 = 8 \right]$$

3. Evaluate: $\left(64^{\frac{1}{2}} \cdot 8^{\frac{2}{3}} \right)$

Calculating each part separately:

$$\left[64^{\frac{1}{2}} = 8 \quad \text{\textit{(since } } 8^2 = 64 \text{\textit{)}}} \right]$$

For $\left(8^{\frac{2}{3}} \right)$:

$$\left[8^{\frac{2}{3}} = (2^3)^{\frac{2}{3}} = 2^2 = 4 \right]$$

Now, multiply these results:

$$\left[\right]$$

$$8 \cdot 4 = 32$$

4. Evaluate: $\left(\left(81^{\frac{1}{4}} \right)^2 \right)$

Knowing that $(81 = 3^4)$:

$$\left(\left(81^{\frac{1}{4}} \right)^2 \right) = (3^4)^{\frac{1}{4} \cdot 2} = 3^{4 \cdot \frac{1}{2}} = 3^2 = 9$$

5. Evaluate: $\left(\frac{125^{\frac{3}{2}}}{25^{\frac{1}{2}}} \right)$

First, simplify each term:

$$125^{\frac{3}{2}} = (5^3)^{\frac{3}{2}} = 5^{3 \cdot \frac{3}{2}} = 5^{\frac{9}{2}}$$

$$25^{\frac{1}{2}} = (5^2)^{\frac{1}{2}} = 5^{2 \cdot \frac{1}{2}} = 5^1 = 5$$

Now substitute:

$$\frac{5^{\frac{9}{2}}}{5^1} = 5^{\frac{9}{2} - 1} = 5^{\frac{7}{2}} = \sqrt{5^7} = 25\sqrt{5}$$

6. Evaluate: $\left(32^{\frac{5}{5}} \cdot 4^{\frac{1}{2}} \right)$

Simplify:

$$32^{\frac{5}{5}} = 32^1 = 32$$

$$4^{\frac{1}{2}} = 2$$

Now multiply:

$$32 \cdot 2 = 64$$

7. Evaluate: $\left(\left(9^{\frac{1}{2}} \right) \cdot \right)$

$27^{\frac{2}{3}}$)

Calculate each part:

$$9^{\frac{1}{2}} = 3$$

For $27^{\frac{2}{3}}$:

$$27^{\frac{2}{3}} = 9$$

Now combine:

$$3 \cdot 9 = 27$$

Conclusion

Understanding and working with rational exponents is a key skill in algebra. By practicing the problems provided and reviewing the answers, you can enhance your proficiency in this area. Remember to refer back to the properties of rational exponents as you solve similar problems in the future. Mastery of these concepts will not only aid you in academic pursuits but will also be beneficial in practical applications of mathematics. Happy studying!

Frequently Asked Questions

What are rational exponents?

Rational exponents are exponents that can be expressed as a fraction, where the numerator represents the power and the denominator represents the root.

How do you convert a rational exponent to a radical form?

To convert a rational exponent to radical form, you express it as the root of the base. For example, $x^{\frac{m}{n}}$ can be written as $\sqrt[n]{x^m}$.

What is the common mistake when dealing with rational exponents?

A common mistake is incorrectly applying the rules of exponents, such as forgetting to apply the root when simplifying the expression.

What is the significance of the base in rational

exponents?

The base in rational exponents determines the quantity being raised to a power or being rooted. It influences the outcome of the expression significantly.

Can you give an example of a rational exponent?

Sure! For instance, $16^{(1/2)}$ is a rational exponent that equals the square root of 16, which is 4.

How do you simplify expressions with rational exponents?

You simplify expressions with rational exponents by applying the laws of exponents, converting to radical form when necessary, and reducing to simplest terms.

What is the relationship between rational exponents and fractional bases?

Rational exponents can also be applied to fractional bases, allowing for expressions like $(1/4)^{(3/2)}$, which can be simplified using the same rules.

Are rational exponents only applicable to positive numbers?

No, rational exponents can be applied to negative and positive numbers, but the results may involve complex numbers when dealing with roots of negative bases.

How do you solve equations involving rational exponents?

To solve equations involving rational exponents, you can isolate the variable, convert the exponent to radical form, and then solve for the variable.

What are the real-world applications of rational exponents?

Rational exponents are used in various fields such as engineering, physics, and finance, particularly in calculations involving growth rates, areas, and volumes.
