Interpret the data: Based on this evidence, write a statement that helps answer the scientific question. Connect the pattern in the data to a pattern in the natural world. Justify your reasoning using data.

Invasive and native plants have similar numbers of insect per plant (0.089 and 0.088 respectively) and similar percent leaves damaged (34.78% and 32.73% respectively). Therefore, there is no evidence that invasive plants are successful because they have escaped their enemies. In order to find support for the enemy escape hypothesis, invasive plants would have had to either have lower numbers of insects per plant, or lower damage from insect herbivores. The data do not support either of these predictions.

Your next step as a scientist: Science is an ongoing process. Did this study fully answer your original question? What new questions do you think should be investigated? What future data should be collected to answer them?

Because we did not find evidence for escape from insect herbivores in this experiment, our future experiments are looking at other types of enemies (such as disease and mammal herbivores).

If we continue to find no evidence for enemy escape, we will look into other mechanisms that might explain invasive species success - for example, invasive species could be more tolerant to enemy damage. In this case, a similar amount of damage on a native and invasive plant may lead to very different outcomes for the two species. The invasive species would be tolerant of the damage and able to perform well, while the native species would not be as tolerant and would experience reduced performance (growth, flower #, survival) compared to invasives.
