## Interior Angles in a Polygon Worksheet

Solved Example:

$$\begin{aligned}\text{Sum of the interior angles} &= (\text{Number of sides} - 2) \times 180^\circ \\ &= (5 - 2) \times 180^\circ \\ &= 3 \times 180^\circ = 540^\circ\end{aligned}$$

$$\begin{aligned}\text{Sum of the interior angles} &= 120^\circ + 118^\circ + 130^\circ + 80^\circ + x^\circ \\ 540^\circ &= 448^\circ + x^\circ \\ x^\circ &= 92^\circ\end{aligned}$$

Find the missing interior angle(s) for each polygon.

## Understanding Angles in a Polygon Worksheet

**Angles in a polygon worksheet** is a fundamental educational resource designed to help students grasp the concepts related to the angles formed within various types of polygons. Polygons, which are two-dimensional geometric figures with straight sides, are categorized based on the number of sides they possess. The study of angles in polygons not only enhances students' understanding of geometry but also lays the groundwork for more advanced mathematical concepts. This article will explore the significance of

angles in polygons, the formulas involved, and how worksheets can aid in mastering these concepts.

## The Basics of Polygons

Polygons can be classified based on the number of their sides and angles. Here are a few common types:

- **Triangle:** A polygon with three sides.
- **Quadrilateral:** A polygon with four sides.
- **Pentagon:** A polygon with five sides.
- **Hexagon:** A polygon with six sides.
- **Heptagon:** A polygon with seven sides.
- **Octagon:** A polygon with eight sides.
- **Nonagon:** A polygon with nine sides.
- **Decagon:** A polygon with ten sides.

Each type of polygon has its unique properties, and understanding these properties is crucial when working with angles.

## Angle Properties of Polygons

The angles of a polygon are an essential aspect of its geometric properties. The sum of the interior angles of a polygon can be calculated using the formula:

$$\text{Sum of Interior Angles} = (n - 2) \times 180^\circ$$

where  $n$  represents the number of sides in the polygon. This formula is derived from the fact that a polygon can be divided into triangles, and since the sum of the angles in a triangle is always  $180^\circ$ , we can generalize this for any polygon.

## Examples of Interior Angle Calculations

Let's see how this formula applies to different polygons:

1. Triangle ( $n = 3$ ):

$$\text{Sum of Interior Angles} = (3 - 2) \times 180^\circ = 1 \times 180^\circ = 180^\circ$$

2. Quadrilateral ( $n = 4$ ):

$$\text{Sum of Interior Angles} = (4 - 2) \times 180^\circ = 2 \times 180^\circ = 360^\circ$$

3. Pentagon ( $n = 5$ ):

$$\text{Sum of Interior Angles} = (5 - 2) \times 180^\circ = 3 \times 180^\circ = 540^\circ$$

4. Hexagon ( $n = 6$ ):

$$\text{Sum of Interior Angles} = (6 - 2) \times 180^\circ = 4 \times 180^\circ = 720^\circ$$

These calculations show how the sum of interior angles increases as the number of sides increases.

## Exterior Angles of Polygons

In addition to interior angles, the concept of exterior angles is equally important. The exterior angle of a polygon is formed when one side of the polygon is extended. The sum of the exterior angles of any polygon is always  $360^\circ$ , regardless of the number of sides. This can be represented mathematically as:

$$\text{Sum of Exterior Angles} = 360^\circ$$

This property is beneficial when solving problems involving both interior and exterior angles.

## Calculating Exterior Angles

If we know the measure of each interior angle, we can easily find the exterior angle using the relationship:

**Exterior Angle =  $180^\circ$  - Interior Angle**

For example, if a triangle has an interior angle of  $60^\circ$ , the corresponding exterior angle would be:

$$\text{Exterior Angle} = 180^\circ - 60^\circ = 120^\circ$$

## Utilizing Angles in a Polygon Worksheets

Worksheets focusing on angles in polygons serve as excellent tools to reinforce these concepts. They typically include a variety of problems that challenge students to apply their knowledge in practical situations. These worksheets can take different forms, such as:
