Finite Mathematics and Calculus with Applications (7th Edition) by Lial, Greenwell, and Ritchey

Section 1.1- Slopes and Equations of Lines

19. Find the equation of the line through the points (4, 2) and (1, 3). Express the answer in slope-intercept form if possible.

$$\text{The slope of the line is } \frac{3-2}{1-4} = \frac{1}{-3} = -\frac{1}{3}.$$

The equation of the line must be $y = -\frac{1}{3}x + b$. To find b we can use the point (1, 3). Substitute $x = 1$ and $y = 3$ and solve for b.

$$3 = -\frac{1}{3}(1) + b \Rightarrow 3 + \frac{1}{3} = b \Rightarrow b = 10/3.$$

$$\text{Therefore the equation of the line is } y = -\frac{1}{3}x + \frac{10}{3}.$$

31. Find the equation of the line through (3, -4) perpendicular to $x + y = 4$.

Find the slope of the line $x + y = 4$ by solving for y.
 $y = -x + 4 \Rightarrow$ this line has slope -1 .

If 2 lines are perpendicular then their slopes are negative reciprocals. Therefore, a line perpendicular to $x + y = 4$ has slope 1 and must be $y = x + b$. Using the point (3, -4) we see that
 $-4 = 3 + b \Rightarrow -7 = b \Rightarrow b = -7$.
Therefore the equation of the perpendicular line through (3, -4) is $y = x - 7$.

35. Do the points (4, 3), (2, 0), and (-18, -12) lie on the same line?
