Understanding Bipolar Disorder

Bipolar disorder, previously known as manic-depressive illness, is a mental health condition characterized by extreme mood swings. These mood swings can include emotional highs (mania or hypomania) and lows (depression). The condition can significantly impact daily life, relationships,

and overall well-being.

Types of Bipolar Disorder

There are several types of bipolar disorder, including:

1. **Bipolar I Disorder:** Defined by manic episodes lasting at least seven days or by manic symptoms that are so severe that immediate hospital care is needed. Depressive episodes occur as well, lasting at least two weeks.
2. **Bipolar II Disorder:** Defined by a pattern of depressive episodes and hypomanic episodes (less severe than full-blown mania), but no full-blown manic episodes.
3. **Cyclothymic Disorder:** Periods of hypomanic symptoms and periods of depressive symptoms lasting for at least two years (one year in children and adolescents).
4. **Other Specified and Unspecified Bipolar and Related Disorders:** Bipolar disorder symptoms that do not match the three categories listed above.
