Cheat sheet calculus 1 is an essential tool for students embarking on their journey through the world of calculus. It serves as a concise summary of fundamental concepts, formulas, and techniques that are vital for understanding and solving problems in introductory calculus. This article aims to provide a comprehensive overview of key topics covered in Calculus 1, including limits, derivatives, integrals, and applications. By the end, readers will have a solid foundation to reference and study from as they tackle their calculus coursework.

Understanding Limits

Limits are foundational to calculus as they describe the behavior of functions as they approach a specific point.

Definition of a Limit

The limit of a function $f(x)$ as x approaches a is denoted as:

$$\lim_{x \rightarrow a} f(x) = L$$

This means that as x gets closer to a , $f(x)$ gets closer to L .

Limit Properties

- Sum: $\lim_{x \rightarrow a} [f(x) + g(x)] = \lim_{x \rightarrow a} f(x) + \lim_{x \rightarrow a} g(x)$
- Difference: $\lim_{x \rightarrow a} [f(x) - g(x)] = \lim_{x \rightarrow a} f(x) - \lim_{x \rightarrow a} g(x)$
- Product: $\lim_{x \rightarrow a} [f(x) \cdot g(x)] = \lim_{x \rightarrow a} f(x) \cdot \lim_{x \rightarrow a} g(x)$
- Quotient: $\lim_{x \rightarrow a} \frac{f(x)}{g(x)} = \frac{\lim_{x \rightarrow a} f(x)}{\lim_{x \rightarrow a} g(x)}$ (provided $\lim_{x \rightarrow a} g(x) \neq 0$)

Finding Limits

To find limits, students often use:

- Direct substitution
- Factoring
- Rationalizing
- L'Hôpital's Rule (for indeterminate forms)

Derivatives

The derivative represents the rate of change of a function. It is a fundamental concept in calculus that enables us to understand how functions behave.

Definition of a Derivative

The derivative of a function $f(x)$ at a point a is defined as:

$$f'(a) = \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h}$$

This formula is the basis for calculating the slope of the tangent line to the curve at the point $(a, f(a))$.

Common Derivatives

Here is a list of the derivatives of some basic functions:

- $\frac{d}{dx}(c) = 0$ (where c is a constant)

2. $\frac{d}{dx}(x^n) = nx^{n-1}$
3. $\frac{d}{dx}(\sin x) = \cos x$
4. $\frac{d}{dx}(\cos x) = -\sin x$
5. $\frac{d}{dx}(e^x) = e^x$
6. $\frac{d}{dx}(\ln x) = \frac{1}{x}$
7. $\frac{d}{dx}(a^x) = a^x \ln a$ (where a is a constant)

Derivative Rules

1. Power Rule: $\frac{d}{dx}(x^n) = nx^{n-1}$
2. Product Rule: $\frac{d}{dx}(uv) = u'v + uv'$
3. Quotient Rule: $\frac{d}{dx}\left(\frac{u}{v}\right) = \frac{u'v - uv'}{v^2}$
4. Chain Rule: $\frac{d}{dx}(f(g(x))) = f'(g(x))g'(x)$

Applications of Derivatives

Derivatives have many applications in various fields, particularly in optimization and motion.

Finding Critical Points

To find critical points of a function $f(x)$:

1. Take the derivative $f'(x)$.
2. Set $f'(x) = 0$ and solve for x .
3. Identify where $f'(x)$ is undefined.

First Derivative Test

To determine whether a critical point is a local maximum, minimum, or neither:

- If f' changes from positive to negative, f has a local maximum.
- If f' changes from negative to positive, f has a local minimum.
- If f' does not change signs, f is neither.

Second Derivative Test

1. Find the second derivative $f''(x)$.
2. Evaluate $f''(x)$ at critical points:
 - If $f''(x) > 0$, f has a local minimum.
 - If $f''(x) < 0$, f has a local maximum.
 - If $f''(x) = 0$, the test is inconclusive.

Integrals

Integrals are essential for calculating areas under curves and understanding accumulated quantities.

Definite and Indefinite Integrals

- Indefinite Integral: Represents a family of functions and is denoted as:

$$\int f(x) \, dx = F(x) + C$$

where $F'(x) = f(x)$ and C is the constant of integration.

- Definite Integral: Represents the area under the curve from a to b :

$$\int_a^b f(x) \, dx = F(b) - F(a)$$

where F is the antiderivative of f .

Common Integrals

- $\int x^n \, dx = \frac{x^{n+1}}{n+1} + C$ (for $n \neq -1$)
- $\int e^x \, dx = e^x + C$
- $\int \sin x \, dx = -\cos x + C$
- $\int \cos x \, dx = \sin x + C$
- $\int \frac{1}{x} \, dx = \ln |x| + C$

Fundamental Theorem of Calculus

This theorem connects differentiation and integration:

1. If F is an antiderivative of f on an interval $[a, b]$, then:

$$\int_a^b f(x) \, dx = F(b) - F(a)$$

2. If f is continuous on $[a, b]$, then the function $F(x) = \int_a^x f(t) \, dt$ is differentiable on (a, b) and $F'(x) = f(x)$.
