Colligative Properties Worksheet With Answers

Name: _____ Date: _____

PART A – CALCULATIONS

1. Indicate how many particles are formed when the following solutes dissolve.

SOLUTE	# OF PARTICLES	SOLUTE	# OF PARTICLES
sucrose ($C_{12}H_{22}O_{11}$)		magnesium chloride ($MgCl_2$)	
sodium sulfate (Na_2SO_4)		methanol (CH_3OH)	

2. When 5.0 g of $CaCl_2$ dissolves in 50.0 g of water, what is the boiling point of the solution? (K_b Water = 0.512 °C/m)

3. Find the boiling point of a solution containing 6.0 g benzene, C_6H_6, in 35 g of napthalene. (Kb of naphthalene = 5.65 °C/m)

4. Mrs. E's feet are aching at the end of a long day. At home, she dissolves 26.0 g of Epsom salt, $MgSO_4$, in 1.5 kg of water. What is the freezing point of this solution? (K_f water = 1.86 °C/m)

PART B – APPLICATIONS

5. Salt is often used to remove ice from roads and sidewalks. Explain how this process works in terms of colligative properties.

6. Which salt, NaCl or $CaCl_2$, has a greater effect on freezing point? Explain.

7. Imagine you are a famous chef cooking spaghetti for your favorite chemistry teacher – she is very interested in your technique and would like to know more about the chemistry behind your amazing cooking! How much would the boiling point of 1L of your pasta water change if you added 20g of NaCl to it?

8. A solution contains 21.6 g of a nonelectrolyte and 175 g of water. The water freezes at -7.18° C and Kf = 1.86° C/m. Is the nonelectrolyte CH3OH or C2H5OH?

9. Calculate the freezing point of a solution made from 32.7 g of propane, C3H8, dissolved in 137.0 g of benzene, C6H6. The freezing point of benzene is 5.50° C and its Kf is 5.12° C/m.

Colligative properties worksheet with answers is a valuable resource for students and educators alike, particularly in chemistry. Colligative properties are essential concepts that help us understand how solutes affect the physical properties of a solvent. This article will delve into the definition of colligative properties, their significance, the types of colligative properties, and a comprehensive worksheet complete with answers to enhance learning.

Understanding Colligative Properties

Colligative properties refer to the properties of solutions that depend on the number of solute particles in a given amount of solvent, rather than the identity of the solute itself. This means that the

physical characteristics of a solvent can change dramatically when different solutes are added, provided that the amount of solute is the same.

Significance of Colligative Properties

Colligative properties are crucial in various scientific and industrial applications, including:

- Determining Molecular Weights: Colligative properties can help in calculating the molecular weight of unknown substances through methods such as freezing point depression and boiling point elevation.
- Understanding Biological Processes: In biology, understanding how solutes affect cell behavior in solutions can lead to insights into osmosis and cellular function.
- Industrial Applications: In industries where solutions are used, knowledge of colligative properties can influence the design and optimization of processes such as crystallization, extraction, and purification.

Types of Colligative Properties

There are four primary types of colligative properties:

1. Vapor Pressure Lowering
2. Boiling Point Elevation
3. Freezing Point Depression
4. Osmotic Pressure

Each of these properties can be defined and calculated based on the concentration of solute particles in a solution.

1. Vapor Pressure Lowering

When a non-volatile solute dissolves in a solvent, the vapor pressure of the solvent decreases. This phenomenon occurs because solute particles occupy space at the surface of the liquid, reducing the number of solvent molecules that can escape into the vapor phase.

- Formula:
$$
\Delta P = P^0 - P = X_{solute} \times P^0
$$
Where:
- ΔP = change in vapor pressure
- P^0 = vapor pressure of the pure solvent
- P = vapor pressure of the solution
- X_{solute} = mole fraction of the solute

2. Boiling Point Elevation

The boiling point of a solution increases when a solute is added. This elevation occurs because the presence of solute particles requires additional energy (in the form of heat) to reach the boiling point.

- Formula:
$$
\Delta T_b = i \times K_b \times m
$$
Where:
- ΔT_b = boiling point elevation
- i = van 't Hoff factor (number of particles the solute breaks into)
- K_b = ebullioscopic constant of the solvent
- m = molality of the solution

3. Freezing Point Depression

Conversely, the freezing point of a solution decreases when a solute is added. This occurs because solute particles disrupt the formation of the solid structure of the solvent, requiring a lower temperature to achieve freezing.

- Formula:
$$
\Delta T_f = i \times K_f \times m
$$
Where:
- ΔT_f = freezing point depression
- K_f = cryoscopic constant of the solvent

4. Osmotic Pressure

Osmotic pressure is the pressure required to prevent the flow of solvent into a solution through a semipermeable membrane. It is dependent on the concentration of solute particles.

- Formula:
$$
\Pi = i \times C \times R \times T
$$
Where:
- Π = osmotic pressure
- C = molar concentration of the solution
- R = ideal gas constant
- T = temperature in Kelvin

Colligative Properties Worksheet

To solidify your understanding of colligative properties, here's a worksheet that includes problems related to the aforementioned properties, followed by answers and explanations.

Worksheet Problems

1. Vapor Pressure Lowering:
A solution is made by dissolving 0.5 moles of a non-volatile solute in 2.0 moles of water. The vapor pressure of pure water is 23.8 mmHg. Calculate the vapor pressure of the solution.

2. Boiling Point Elevation:
Calculate the boiling point of a solution made by dissolving 1 mole of NaCl (i = 2) in 1 kg of water (K_b for water = 0.512 °C kg/mol).

3. Freezing Point Depression:
If 2 moles of glucose ($C_6H_{12}O_6$) are dissolved in 1 kg of water, calculate the new freezing point of the solution (K_f for water = 1.86 °C kg/mol).

4. Osmotic Pressure:
What is the osmotic pressure of a solution containing 0.1 moles of NaCl in 1 liter of solution at 25°C? (Use R = 0.0821 L·atm/(K·mol)).

Answers and Explanations

1. Vapor Pressure Lowering:
- Mole fraction of water, $X_{water} = \frac{2.0}{2.0 + 0.5} = 0.8$
- Vapor pressure of solution, $P = X_{water} \times P^0 = 0.8 \times 23.8 = 19.04 \, mmHg$

2. Boiling Point Elevation:
- $\Delta T_b = i \times K_b \times m = 2 \times 0.512 \times 1 = 1.024 °C$
- Boiling point = 100 °C + 1.024 °C = 101.024 °C

3. Freezing Point Depression:
- $\Delta T_f = i \times K_f \times m = 1 \times 1.86 \times 2 = 3.72 °C$
- Freezing point = 0 °C - 3.72 °C = -3.72 °C

4. Osmotic Pressure:
- $\Pi = i \times C \times R \times T = 2 \times 0.1 \, mol/L \times 0.0821 \, L·atm/(K·mol) \times 298 \, K$
- $\Pi = 4.89 \, atm$

Conclusion

Colligative properties are fundamental concepts in chemistry that play a critical role in understanding how solutes affect the behavior of solvents. By using a worksheet with problems and solutions, students can enhance their comprehension and application of these principles. As we've explored in this article, mastering colligative properties not only aids in academic pursuits but also has practical implications in various scientific fields and industries.

Frequently Asked Questions

What are colligative properties in chemistry?

Colligative properties are properties of solutions that depend on the number of solute particles in a given amount of solvent, rather than the identity of the solute.

What are the four main types of colligative properties?

The four main types of colligative properties are vapor pressure lowering, boiling point elevation, freezing point depression, and osmotic pressure.

How do you calculate the boiling point elevation using a colligative properties worksheet?

To calculate boiling point elevation, use the formula: $\Delta T_b = i K_b m$, where ΔT_b is the change in boiling point, i is the van 't Hoff factor, K_b is the ebullioscopic constant, and m is the molality of the solution.

What is the significance of the van 't Hoff factor in colligative properties?

The van 't Hoff factor (i) accounts for the number of particles a solute dissociates into in solution, which directly influences the magnitude of colligative properties.

How can a colligative properties worksheet help students understand the topic better?

A colligative properties worksheet can provide practice problems, reinforce the concepts through calculations, and help students visualize the effects of solute concentration on boiling and freezing points.

Can colligative properties be observed in all types of solutions?

Yes, colligative properties can be observed in all types of solutions, but their effects are more pronounced in dilute solutions where the concentration of solute particles is low.
