COMP 1113 Applied Mathematics for CST

Practice Questions for Midterm

1. Convert the following values from their current base to the indicated base.
   a. 145_8 to Binary and to Hexadecimal
   b. 564_7 to base 10
   c. 133.4_{10} to binary
   d. 104.55 to binary
   e. 13233_4 to base 10
   f. $AF1_{16}$ to octal
   g. 0.11 kibibits to decimal.

2. Do the indicated arithmetic operation in the base of the numbers.

   a. AFF_{16}
      $+ DED_{16}$

   b. 1344_5
      $- 442_5$

   c. 11011101_2
      -01001100_2

   d. $ED2_{16}$
      $+F28_{16}$

3. Use determinants (Cramers' Method) to find the solution to the following system of equations.
$$0.344a - 0.21b = 0.448$$
$$1.34a + 2.34b = 1.07$$

4. Perform the following matrix algebra operation given the matrices or explain why it can not be done:

$$A = \begin{bmatrix} 1 & 0 & 3 \\ 2 & 5 & -3 \\ 0 & -2 & 2 \end{bmatrix}, \quad B = \begin{bmatrix} 2 & 1 & 1 \\ -2 & 0 & 3 \end{bmatrix}, \quad C = \begin{bmatrix} 1 & 5 & 0 \\ -2 & 0 & 1 \end{bmatrix}$$

   a) $BA + 3C$
   b) BC

5. A simple to implement (and unfortunately simple to break) encryption method involves taking information (in some numerical form such as binary) rearranged in the form of a $m \times n$ matrix, I, and multiplying it by a standard *encoding matrix*, E, to recode it into a new matrix of numbers. The encoded matrix to be transmitted is then given by $T = EI$. To decode the information you can multiply the transmitted matrix by the matrix inverse of the encoding matrix, E^{-1} and you should get back the original information, $I = E^{-1}T$.

   a. In the following problem the binary string (representing the secret information) 1011001011 is made into an information matrix $I = \begin{bmatrix} 1 & 1 & 0 & 1 & 1 \\ 0 & 1 & 0 & 0 & 1 \end{bmatrix}$. Notice that this was just the result of taking each group of 2 bits and putting them into a column. Use an encoding matrix $E = \begin{bmatrix} 1 & 4 \\ -2 & 7 \end{bmatrix}$ to find the matrix to be transmitted, T.

   b. If you receive a transmitted matrix $T = \begin{bmatrix} 5 & 4 & 1 \\ 5 & 7 & -2 \end{bmatrix}$, find the original information matrix that had been transmitted. $I = E^{-1}T$ (No it is not the one from part a). In finding the decoding matrix you must clear show and label all steps in finding E^{-1}.
