- If you plot an equation on a graph, the integral is equal to the _____.
- Velocity is the integral of _____, and position is the integral of _____.
- How can you calculate an integral using the power rule used for derivatives and running it backwards? Describe and give an example.
- Constants pose a problem when it comes to integrals because the derivative of a constant is just _____. A derivative is a rate of change, after all, so a constant, by definition _____, and so will always have a derivative of zero.
 - Whatever the constant is equal to, that's where the curve will _____ with the _____.
 - Mathematicians had to figure out how to get around the problem of having _____ integrals to choose from, so they came up with a way to represent all of them: just add a _____ at the _____ of the integral.
- What is the initial value? What is its role in graphing?
 - The velocity graph tells you what the velocity is for each _____. But we had to add the C, because we didn't know where to place it on the vertical axis—when _____.
- What is the equation for the definition of acceleration?
- What is the displacement curve formula?
