

Density Practice Problems With Answers

Density Practice Problems Worksheet #2

Answer Key

1. You have a rock with a volume of 15cm^3 and a mass of 45 g. What is its density?

$$\text{Density} = m/v$$

$$\text{Density} = 45\text{g}/15\text{cm}^3$$

$$\text{Density} = 3.0\text{g}/\text{cm}^3$$

2. You have a different rock with a volume of 30cm^3 and a mass of 60g. What is its density?

$$\text{Density} = m/v$$

$$\text{Density} = 60\text{g}/30\text{cm}^3$$

$$\text{Density} = 2.0\text{g}/\text{cm}^3$$

3. In the above two examples which rock is more dense? Why?

Rock sample #1, because it has a density of $3.0\text{g}/\text{cm}^3$, which is greater than rock sample #2's density of $2.0\text{g}/\text{cm}^3$

4. Calculate the mass of a liquid with a density of 3.2 g/mL and a volume of 25 mL.

$$\text{Mass} = D \times V$$

$$\text{Mass} = 3.2\text{g}/\text{ml} \times 25\text{ ml}$$

$$\text{Mass} = 80.0\text{ g}$$

5. Calculate the density of a 500g rectangular block with the following dimensions: length=8 cm, width=6 cm, height=5 cm.

$$\text{Density} = m/v$$

$$\text{Density} = 500\text{g}/240\text{cm}^3 \text{ (} 8\text{cm} \times 6\text{cm} \times 5\text{cm)}$$

$$\text{Density} = 2.083, \text{ rounded to nearest tenth} = 2.1\text{ g}/\text{cm}^3$$

6. Calculate the mass of a solid metal block with a density of $2.6\text{ g}/\text{cm}^3$, a width of 1.8 cm, a length of 4 cm, and a height of 2.3 cm.

$$\text{Mass} = D \times V$$

$$\text{Mass} = 2.6\text{g}/\text{cm}^3 \times (1.8\text{cm} \times 4\text{cm} \times 2.3\text{ cm})$$

$$\text{Mass} = 2.6\text{g}/\text{cm}^3 \times 16.56\text{cm}^3$$

$$\text{Mass} = 43.056\text{g} - \text{rounded to nearest tenth} = 43.1\text{ g}$$

Density practice problems with answers are an essential part of mastering the concept of density in chemistry and physics. Understanding density, which is defined as mass per unit volume, is crucial for solving various scientific problems. In this article, we will explore some density practice problems, provide detailed solutions, and discuss the relevance of these problems in real-world applications. Whether you're a student preparing for exams or an enthusiast looking to reinforce your understanding, this guide will help you gain confidence in tackling density-related questions.

Understanding Density

Before diving into practice problems, it's important to understand what

density is and how it is calculated. The formula for density (ρ) is given by:

$$\rho = \frac{m}{V}$$

where:

- ρ = density (usually in grams per cubic centimeter, g/cm³)
- m = mass (in grams, g)
- V = volume (in cubic centimeters, cm³)

Density is a physical property of matter and varies from one substance to another. For instance, metals typically have high densities, while gases have low densities.

Types of Density Problems

Density problems can be categorized into several types:

- **Finding Density:** Given mass and volume, calculate density.
- **Finding Volume:** Given mass and density, calculate volume.
- **Finding Mass:** Given density and volume, calculate mass.
- **Comparative Density:** Comparing the densities of different substances.

Let's explore these types with practice problems and their solutions.

Density Practice Problems

Problem 1: Finding Density

A cube of metal has a mass of 150 grams and a volume of 50 cm³. What is the density of the metal?

Solution:

Using the formula for density:

$$\rho = \frac{m}{V} = \frac{150 \text{ g}}{50 \text{ cm}^3} = 3 \text{ g/cm}^3$$

Thus, the density of the metal is 3 g/cm³.

Problem 2: Finding Volume

A liquid has a density of 1.2 g/cm³, and you have 240 grams of this liquid. What is the volume of the liquid?

Solution:

Rearranging the density formula to find volume:

$$V = \frac{m}{\rho} = \frac{240 \text{ g}}{1.2 \text{ g/cm}^3} = 200 \text{ cm}^3$$

Therefore, the volume of the liquid is 200 cm³.

Problem 3: Finding Mass

A substance has a volume of 10 cm³ and a density of 8 g/cm³. Calculate the mass of the substance.

Solution:

Using the density formula:

$$m = \rho \times V = 8 \text{ g/cm}^3 \times 10 \text{ cm}^3 = 80 \text{ g}$$

The mass of the substance is 80 grams.

Problem 4: Comparative Density

You have two liquids: Liquid A with a density of 0.9 g/cm³ and Liquid B with a density of 1.0 g/cm³. If equal volumes of both liquids are mixed, which liquid will float on top and why?

Solution:

Since Liquid A has a lower density (0.9 g/cm^3) compared to Liquid B (1.0 g/cm^3), Liquid A will float on top of Liquid B. In general, less dense substances float on more dense substances.

Problem 5: Mixed Problem

A 500 g block of a substance is submerged in water. The water level rises by 250 cm^3 . What is the density of the substance?

Solution:

First, calculate the volume of the substance based on the water displacement method:

$$V = 250 \text{ cm}^3$$

Now, use the density formula:

$$\rho = \frac{m}{V} = \frac{500 \text{ g}}{250 \text{ cm}^3} = 2 \text{ g/cm}^3$$

Thus, the density of the substance is 2 g/cm^3 .

Applications of Density in Real Life

Understanding density is not just an academic exercise; it has significant applications in various fields:

- **Engineering:** Density affects material selection in construction and manufacturing.
- **Environmental Science:** Density helps in understanding the behavior of pollutants in different mediums.
- **Medicine:** Density measurements are essential in diagnosing and treating certain medical conditions.
- **Cooking:** Density influences how different ingredients interact, particularly in baking.

Conclusion

In conclusion, practicing with **density practice problems with answers** is an effective way to solidify your understanding of this fundamental concept. By mastering the calculations related to density, mass, and volume, you can apply these principles in various scientific and practical contexts. Whether you are preparing for exams, conducting experiments, or simply exploring the world around you, a firm grasp of density will serve you well. Keep practicing, and you'll find that solving density problems becomes second nature!

Frequently Asked Questions

What is the formula for calculating density?

Density is calculated using the formula: $\text{Density} = \text{Mass} / \text{Volume}$.

How do you convert grams to kilograms when calculating density?

To convert grams to kilograms, divide the mass in grams by 1000.

If an object has a mass of 50 grams and occupies a volume of 20 cm³, what is its density?

$\text{Density} = \text{Mass} / \text{Volume} = 50 \text{ g} / 20 \text{ cm}^3 = 2.5 \text{ g/cm}^3$.

What is the density of water, and how is it commonly used in density problems?

The density of water is approximately 1 g/cm³, and it is often used as a reference point for comparing the densities of other substances.

How can you determine if an object will float or sink in water based on its density?

If the object's density is less than 1 g/cm³, it will float; if it is greater than 1 g/cm³, it will sink.

What is the density of a substance that has a mass of 1500 kg and a volume of 0.5 m³?

$\text{Density} = \text{Mass} / \text{Volume} = 1500 \text{ kg} / 0.5 \text{ m}^3 = 3000 \text{ kg/m}^3$.

How do you find the volume of an irregular object using density?

You can use the water displacement method: submerge the object in water and measure the rise in water level to find the volume.

If you have a cube with a side length of 2 cm and a mass of 16 g, what is its density?

First, calculate the volume of the cube: $\text{Volume} = \text{side}^3 = 2 \text{ cm} \times 2 \text{ cm} \times 2 \text{ cm} = 8 \text{ cm}^3$. Then, $\text{Density} = \text{Mass} / \text{Volume} = 16 \text{ g} / 8 \text{ cm}^3 = 2 \text{ g/cm}^3$.
