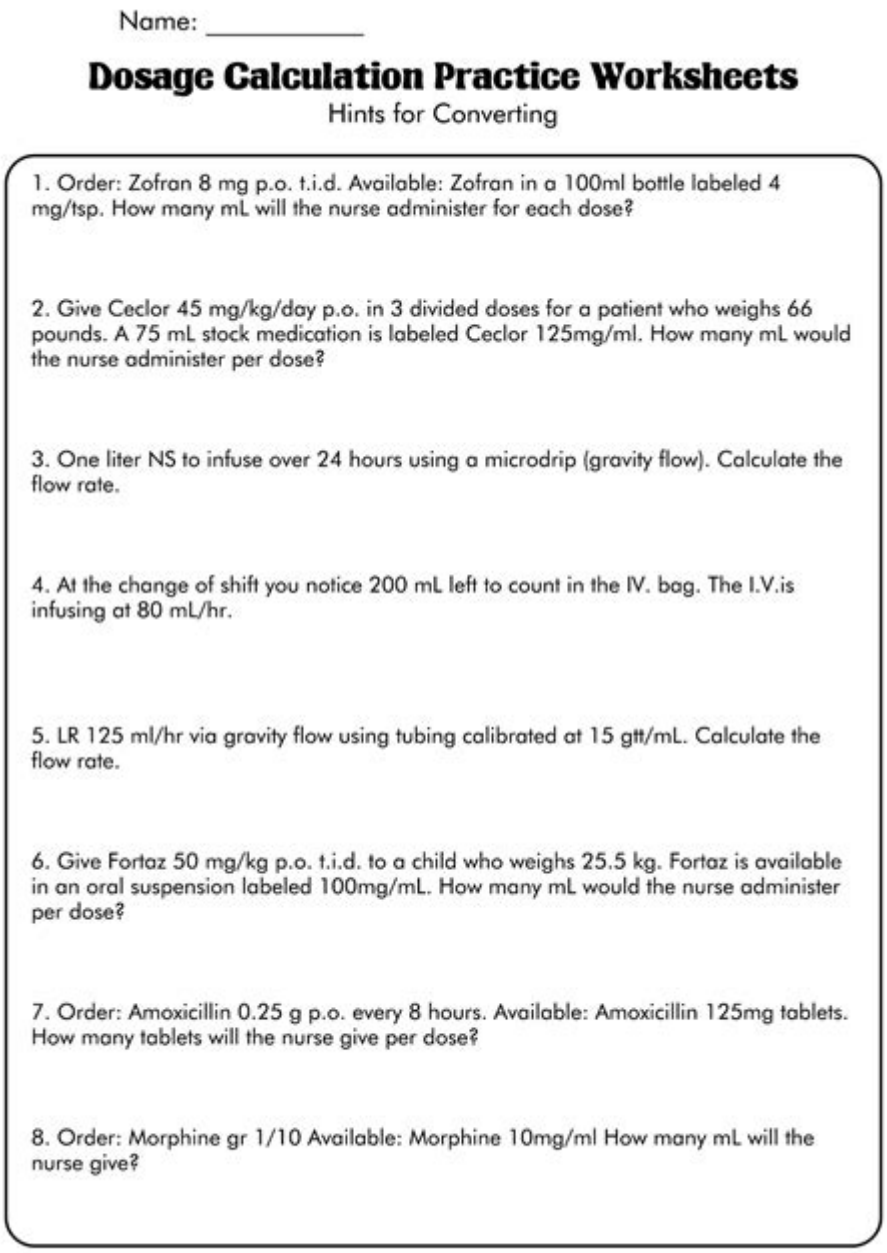
Dosage Calculation Practice Worksheet With Answers



Name: _____

Dosage Calculation Practice Worksheets

Hints for Converting

1. Order: Zofran 8 mg p.o. t.i.d. Available: Zofran in a 100ml bottle labeled 4 mg/tsp. How many mL will the nurse administer for each dose?

2. Give Ceclor 45 mg/kg/day p.o. in 3 divided doses for a patient who weighs 66 pounds. A 75 mL stock medication is labeled Ceclor 125mg/ml. How many mL would the nurse administer per dose?

3. One liter NS to infuse over 24 hours using a microdrip (gravity flow). Calculate the flow rate.

4. At the change of shift you notice 200 mL left to count in the IV. bag. The I.V.is infusing at 80 mL/hr.

5. LR 125 ml/hr via gravity flow using tubing calibrated at 15 gtt/mL. Calculate the flow rate.

6. Give Fortaz 50 mg/kg p.o. t.i.d. to a child who weighs 25.5 kg. Fortaz is available in an oral suspension labeled 100mg/mL. How many mL would the nurse administer per dose?

7. Order: Amoxicillin 0.25 g p.o. every 8 hours. Available: Amoxicillin 125mg tablets. How many tablets will the nurse give per dose?

8. Order: Morphine gr 1/10 Available: Morphine 10mg/ml How many mL will the nurse give?

Dosage calculation practice worksheet with answers is an essential tool for healthcare professionals, especially nurses, pharmacists, and medical students. Accurate dosage calculations are critical for ensuring patient safety and effective treatment. This article will delve into the importance of dosage calculations, provide examples of practice problems, and present a comprehensive worksheet complete with answers.

Understanding Dosage Calculations

Dosage calculations involve determining the appropriate amount of medication to administer to a patient based on various factors, including:

- Patient's age, weight, and health condition
- Medication concentration
- Route of administration
- Prescribed dosage

These calculations can prevent medication errors that could lead to adverse patient outcomes.

Types of Dosage Calculations

There are several common types of dosage calculations that healthcare professionals should be familiar with:

1. Basic Calculations: This includes simple arithmetic, where the dose is calculated based on a single variable.

2. Weight-Based Dosing: Medications are often dosed according to the patient's weight, typically in mg/kg.

3. IV Flow Rate Calculations: Used to determine how quickly an IV medication should be administered.

4. Conversion Calculations: Converting between different units of measurement, such as mg to g or mL to L.

5. Pediatric Dosing: This requires special attention to ensure safe dosing in children, often calculated

using body weight or body surface area.

Dosage Calculation Practice Problems

This section provides various practice problems that cover the types of dosage calculations mentioned earlier. Each problem will be followed by the solution.

Practice Problem 1: Basic Calculation

Problem: A patient is prescribed 500 mg of medication A. The medication is available in 250 mg tablets. How many tablets should the nurse administer?

Solution:

To find the number of tablets needed, divide the prescribed dose by the dose per tablet.

$$
\text{Number of tablets} = \frac{500 \text{ mg}}{250 \text{ mg/tablet}} = 2 \text{ tablets}
$$

Practice Problem 2: Weight-Based Dosing

Problem: A child weighing 20 kg is prescribed medication B at a dosage of 10 mg/kg. How much medication should the child receive?

Solution:

First, calculate the total dosage required by multiplying the child's weight by the dosage per kg.

$$
\text{Total dosage} = 20 \text{ kg} \times 10 \text{ mg/kg} = 200 \text{ mg}
$$

Practice Problem 3: IV Flow Rate Calculation

Problem: An IV solution is ordered at a rate of 75 mL/hour. How many mL will the patient receive in 4 hours?

Solution:

To find the total volume given in 4 hours, multiply the rate by the number of hours.

$$
\text{Total volume} = 75 \text{ mL/hour} \times 4 \text{ hours} = 300 \text{ mL}
$$

Practice Problem 4: Conversion Calculation

Problem: Convert 5000 micrograms (mcg) to milligrams (mg).

Solution:

To convert micrograms to milligrams, divide by 1000 (since 1 mg = 1000 mcg).

$$
\text{Dose in mg} = \frac{5000 \text{ mcg}}{1000} = 5 \text{ mg}
$$

\]

Practice Problem 5: Pediatric Dosing

Problem: A medication is prescribed for a child with a body surface area (BSA) of 1.2 m². The recommended dosage is 15 mg/m². How much medication should be administered?

Solution:

Multiply the BSA by the dosage per m².

\[
\text{Total dosage} = 1.2 \text{ m²} \times 15 \text{ mg/m²} = 18 \text{ mg}
\]

Dosage Calculation Practice Worksheet

Below is a dosage calculation practice worksheet that can be used for self-assessment or group practice.

Instructions: Solve the following problems and check your answers against the solutions provided.

1. Basic Calculation: A patient is prescribed 750 mg of medication C. The medication is available in 500 mg tablets. How many tablets should be administered?

2. Weight-Based Dosing: An adult patient weighing 70 kg is prescribed medication D at a dosage of 5 mg/kg. Calculate the required dosage.

3. IV Flow Rate Calculation: An IV medication is ordered to run at 100 mL/hour. How much medication

will the patient receive in 6 hours?

4. Conversion Calculation: Convert 2500 milligrams (mg) to grams (g).

5. Pediatric Dosing: A medication is prescribed for a child with a weight of 15 kg. The recommended dosage is 12 mg/kg. How much medication should be given?

Answers to the Practice Worksheet

1. Answer:

$$
\text{Number of tablets} = \frac{750 \text{ mg}}{500 \text{ mg/tablet}} = 1.5 \text{ tablets} \quad (\text{Round to 2 tablets if necessary})
$$

2. Answer:

$$
\text{Total dosage} = 70 \text{ kg} \times 5 \text{ mg/kg} = 350 \text{ mg}
$$

3. Answer:

$$
\text{Total volume} = 100 \text{ mL/hour} \times 6 \text{ hours} = 600 \text{ mL}
$$

4. Answer:

$$
\text{Dose in g} = \frac{2500 \text{ mg}}{1000} = 2.5 \text{ g}
$$

5. Answer:

$$
\text{Total dosage} = 15 \text{ kg} \times 12 \text{ mg/kg} = 180 \text{ mg}
$$

Conclusion

Dosage calculation is a vital skill for healthcare professionals. Regular practice with worksheets can help reinforce these skills and enhance confidence in performing calculations accurately. With the provided practice problems and solutions, individuals can test their knowledge and ensure they are prepared for real-world scenarios where medication safety is paramount. Always remember to double-check calculations and consult with a pharmacist or supervisor when in doubt.

Frequently Asked Questions

What is a dosage calculation practice worksheet?

A dosage calculation practice worksheet is a resource used by healthcare students and professionals to practice calculating medication dosages, ensuring they understand the correct amounts to administer based on various parameters.

How can I create effective dosage calculation practice worksheets?

Effective dosage calculation practice worksheets can be created by including a variety of problems that cover different scenarios, such as weight-based dosing, IV drip rates, and conversions between units, along with detailed answer keys.

Where can I find dosage calculation practice worksheets with

answers?

Dosage calculation practice worksheets with answers can be found on educational websites, nursing school resources, and online platforms that provide free or paid healthcare education materials.

What are common types of problems included in dosage calculation practice worksheets?

Common types of problems include calculating dosages based on patient weight, determining IV flow rates, converting between metric and imperial units, and solving problems involving stock solutions.

How can practicing dosage calculations improve patient safety?

Practicing dosage calculations enhances a healthcare professional's ability to accurately determine medication amounts, which reduces the risk of administering incorrect dosages that could lead to patient harm.

What should I do if I struggle with dosage calculations?

If you struggle with dosage calculations, consider seeking additional resources such as tutoring, online courses, or practice problems, and utilize dosage calculation worksheets to reinforce your skills.
