Sample Electric Circuit Worksheet Problems and Answers

Below are some sample problems commonly found in electric circuit worksheets, along with detailed solutions.

Problem 1: Simple Series Circuit

Given a series circuit with a 12V battery and two resistors, $R_1 = 4\Omega$ and $R_2 = 8\Omega$, calculate the total resistance, current flowing through the circuit, and the voltage drop across each resistor.

Solution:

1. Total Resistance (R_{total}):

$$R_{\text{total}} = R_1 + R_2 = 4\Omega + 8\Omega = 12\Omega$$

2. Current (I):

Using Ohm's Law: $I = \frac{V}{R}$

$$I = \frac{12V}{12\Omega} = 1A$$

3. Voltage Drop across R1 (V1):

Using Ohm's Law: $V = IR$

$$V_1 = I \times R_1 = 1A \times 4\Omega = 4V$$

4. Voltage Drop across R2 (V2):

$$V_2 = I \times R_2 = 1A \times 8\Omega = 8V$$

Answer Summary:

- Total Resistance: 12Ω
- Current: $1A$
- Voltage Drop across R1: $4V$
- Voltage Drop across R2: $8V$

Problem 2: Parallel Circuit

Consider a parallel circuit with a 24V battery and two resistors, $R_1 = 6\Omega$ and $R_2 = 12\Omega$. Calculate the total current flowing through the circuit and the current through each resistor.

Solution:

1. Total Resistance (R_{total}):

$$\frac{1}{R_{\text{total}}} = \frac{1}{R_1} + \frac{1}{R_2} = \frac{1}{6\Omega} + \frac{1}{12\Omega}$$

$$\frac{1}{R_{\text{total}}} = \frac{2}{12\Omega} + \frac{1}{12\Omega} = \frac{3}{12\Omega} \Rightarrow R_{\text{total}} = 4\Omega$$

2. Total Current (I_{total}):

Using Ohm's Law:

$$I_{\text{total}} = \frac{V}{R_{\text{total}}} = \frac{24V}{4\Omega} = 6A$$

3. Current through R1 (I1):

$$I_1 = \frac{V}{R_1} = \frac{24V}{6\Omega} = 4A$$

4. Current through R2 (I2):

$$I_2 = \frac{V}{R_2} = \frac{24V}{12\Omega} = 2A$$

Answer Summary:

- Total Current: 6A
- Current through R1: 4A
- Current through R2: 2A

Problem 3: Mixed Circuit

In a circuit with a series and parallel combination, a 10V battery is connected to a resistor $R_1 = 5\Omega$ in series with a parallel combination of $R_2 = 10\Omega$ and $R_3 = 20\Omega$. Calculate the total current supplied by the battery.

Solution:

1. Calculate R2 and R3 in parallel:

$$\frac{1}{R_{\text{parallel}}} = \frac{1}{R_2} + \frac{1}{R_3} = \frac{1}{10\Omega} + \frac{1}{20\Omega}$$
$$\frac{1}{R_{\text{parallel}}} = \frac{2}{20\Omega} + \frac{1}{20\Omega} = \frac{3}{20\Omega} \rightarrow R_{\text{parallel}} \approx 6.67\Omega$$

2. Total Resistance (R_{total}):

$$R_{\text{total}} = R_1 + R_{\text{parallel}} = 5\Omega + 6.67\Omega \approx 11.67\Omega$$

3. Total Current (I_{total}):

Using Ohm's Law:

$$I_{\text{total}} = \frac{V}{R_{\text{total}}} = \frac{10V}{11.67\Omega} \approx 0.857A$$

Answer Summary:

- Total Current: Approximately 0.857A
