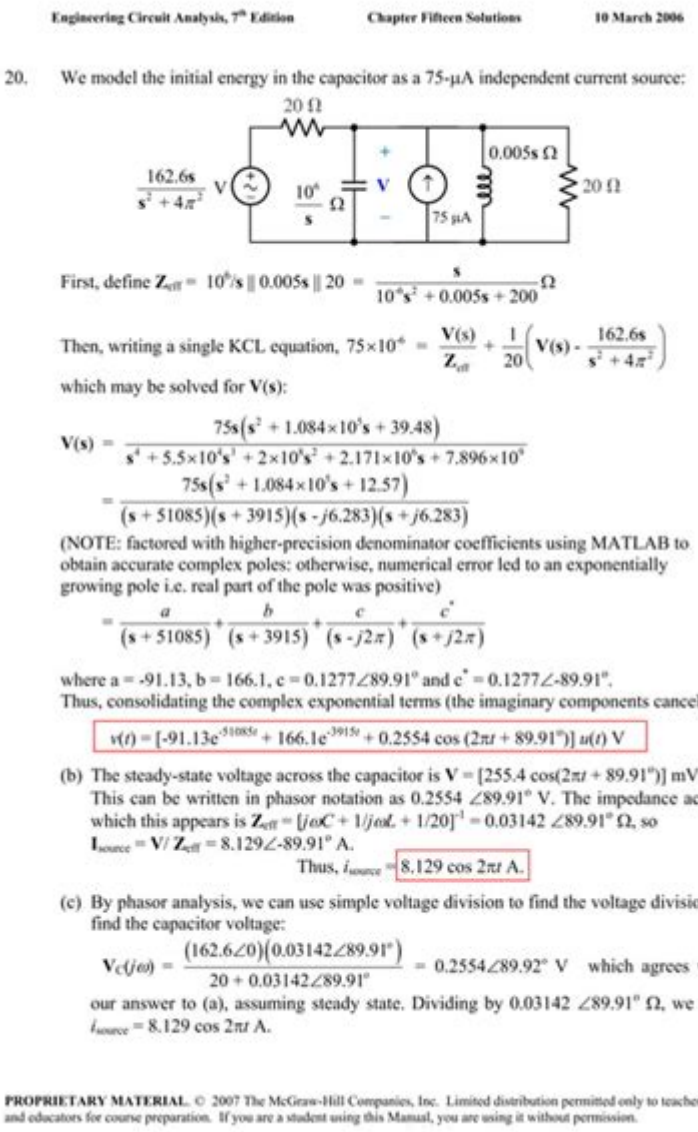
Engineering Circuit Analysis 7th Edition Solutions



Engineering Circuit Analysis, 7th Edition Chapter Fifteen Solutions 10 March 2006

20. We model the initial energy in the capacitor as a 75-μA independent current source:

First, define $\mathbf{Z}_{eff} = 10^6/\mathbf{s} \parallel 0.005\mathbf{s} \parallel 20 = \dfrac{\mathbf{s}}{10^{-6}\mathbf{s}^2 + 0.005\mathbf{s} + 200}\ \Omega$

Then, writing a single KCL equation, $75\times10^{-6} = \dfrac{\mathbf{V(s)}}{\mathbf{Z}_{eff}} + \dfrac{1}{20}\left(\mathbf{V(s)} - \dfrac{162.6\mathbf{s}}{\mathbf{s}^2+4\pi^2}\right)$

which may be solved for **V**(s):

$$\mathbf{V(s)} = \frac{75\mathbf{s}\left(\mathbf{s}^2 + 1.084\times10^5\mathbf{s} + 39.48\right)}{\mathbf{s}^4 + 5.5\times10^4\mathbf{s}^3 + 2\times10^9\mathbf{s}^2 + 2.171\times10^5\mathbf{s} + 7.896\times10^9}$$

$$= \frac{75\mathbf{s}\left(\mathbf{s}^2 + 1.084\times10^5\mathbf{s} + 12.57\right)}{(\mathbf{s}+51085)(\mathbf{s}+3915)(\mathbf{s}-j6.283)(\mathbf{s}+j6.283)}$$

(NOTE: factored with higher-precision denominator coefficients using MATLAB to obtain accurate complex poles: otherwise, numerical error led to an exponentially growing pole i.e. real part of the pole was positive)

$$= \frac{a}{(\mathbf{s}+51085)} + \frac{b}{(\mathbf{s}+3915)} + \frac{c}{(\mathbf{s}-j2\pi)} + \frac{c^*}{(\mathbf{s}+j2\pi)}$$

where a = -91.13, b = 166.1, c = 0.1277∠89.91° and c^* = 0.1277∠-89.91°.
Thus, consolidating the complex exponential terms (the imaginary components cancel),

$$v(t) = [-91.13e^{-51085t} + 166.1e^{-3915t} + 0.2554\cos(2\pi t + 89.91°)]\,u(t)\ \text{V}$$

(b) The steady-state voltage across the capacitor is **V** = [255.4 cos(2π*t* + 89.91°)] mV
This can be written in phasor notation as 0.2554 ∠89.91° V. The impedance across which this appears is $\mathbf{Z}_{eff} = [j\omega C + 1/j\omega L + 1/20]^{-1} = 0.03142\ \angle 89.91°\ \Omega$, so
$\mathbf{I}_{source} = \mathbf{V}/\mathbf{Z}_{eff} = 8.129\angle -89.91°$ A.
Thus, $i_{source} = 8.129\cos 2\pi t$ A.

(c) By phasor analysis, we can use simple voltage division to find the voltage division to find the capacitor voltage:

$$\mathbf{V}_c(j\omega) = \frac{(162.6\angle 0)(0.03142\angle 89.91°)}{20 + 0.03142\angle 89.91°} = 0.2554\angle 89.92°\ \text{V}$$ which agrees with our answer to (a), assuming steady state. Dividing by 0.03142 ∠89.91° Ω, we find $i_{source} = 8.129\cos 2\pi t$ A.
