2–23. If $\theta = 30°$ and $F_2 = 6$ kN, determine the magnitude of the resultant force acting on the plate and its direction measured clockwise from the positive x axis.

Parallelogram Law and Triangular Rule: This problem can be solved by adding the forces successively, using the parallelogram law of addition, shown in Fig. *a*. Two triangular force diagrams, shown in Figs. *b* and *c*, can be desired from the parallelogram.

Determination of Unknowns: Referring to Fig. *b*, F' and α can be determined as follows.

$$F' = \sqrt{4^2 + 5^2} = 6.403 \text{ kN}$$

$$\tan\alpha = \frac{5}{4} \qquad \alpha = 51.34°$$

Using the results for F' and α and referring to Fig. *c*, F_R and β can be determined.

$$F_R = \sqrt{6^2 + 6.403^2 - 2(6)(6.403)\cos(51.34° + 30°)}$$
$$= 8.089 \text{ kN} = 8.09 \text{ kN} \qquad \text{Ans.}$$

$$\frac{\sin\beta}{6} = \frac{\sin(51.34° + 30°)}{8.089} \qquad \beta = 47.16°$$

Thus, the direction angle ϕ of F_R, measured clockwise from the positive x axis, is

$$\phi = \alpha + \beta = 51.34° + 47.16° = 98.5° \qquad \text{Ans.}$$
