- Portability: Designed for ease of use, the monitor is lightweight and can be moved between different areas of the hospital or clinic.

Setup and Operation

Setting up the GE Corometrics 150 Fetal Monitor is straightforward. Here's a step-by-step guide to get started.

Preparation

1. Gather Necessary Equipment: Ensure you have the monitor, transducers (for fetal heart rate and uterine activity), power supply, and any necessary cables.
2. Check Power Supply: Connect the monitor to a power outlet and ensure it is functioning properly.

Connecting Transducers

- Fetal Heart Rate Transducer:
- Place the transducer on the mother's abdomen where the fetal heartbeat is best detected.
- Secure the transducer with an elastic belt or other fastening mechanism to ensure it remains in place.

- Uterine Activity Transducer:
- Position the uterine activity transducer at the fundus of the uterus.
- Follow the same securing process to maintain proper positioning.

Turning on the Monitor

- Press the power button to turn on the monitor.
- Wait for the system to complete its self-check and calibration.

Monitoring Fetal Heart Rate and Uterine Activity

- Once the transducers are connected and the monitor is active, the display will show real-time data.

- Observe the fetal heart rate (FHR) and uterine activity (UA) waveforms on the digital display.
- Use the event marking feature to indicate significant moments during monitoring, such as contractions or maternal movements.

Interpreting Data

Understanding the data provided by the GE Corometrics 150 is vital for effective fetal monitoring and patient care.

Fetal Heart Rate Patterns

- Baseline Fetal Heart Rate: The average FHR over a 10-minute period. Normal ranges from 110 to 160 beats per minute.
- Variability: Refers to the fluctuations in the FHR. A moderate variability (6 to 25 bpm) is reassuring, while reduced or absent variability may indicate fetal distress.
- Accelerations and Decelerations:
- Accelerations: Periodic increases in FHR, typically associated with fetal movement.
- Decelerations: Decreases in FHR, which can be classified as early, variable, or late, indicating different clinical implications.

Uterine Activity Patterns

- Frequency: The number of contractions in a 10-minute period.
- Duration: The length of each contraction from start to finish.
- Intensity: The strength of the contractions, which can be assessed via palpation or intrauterine pressure monitoring.

Maintenance of the GE Corometrics 150 Fetal Monitor

Regular maintenance of the GE Corometrics 150 is essential for optimal performance and longevity of the device.

Daily Checks

- Visual Inspection: Examine the monitor and transducers for any visible damage or wear.

- Calibration: Ensure that the monitor is calibrated correctly for accurate readings.
