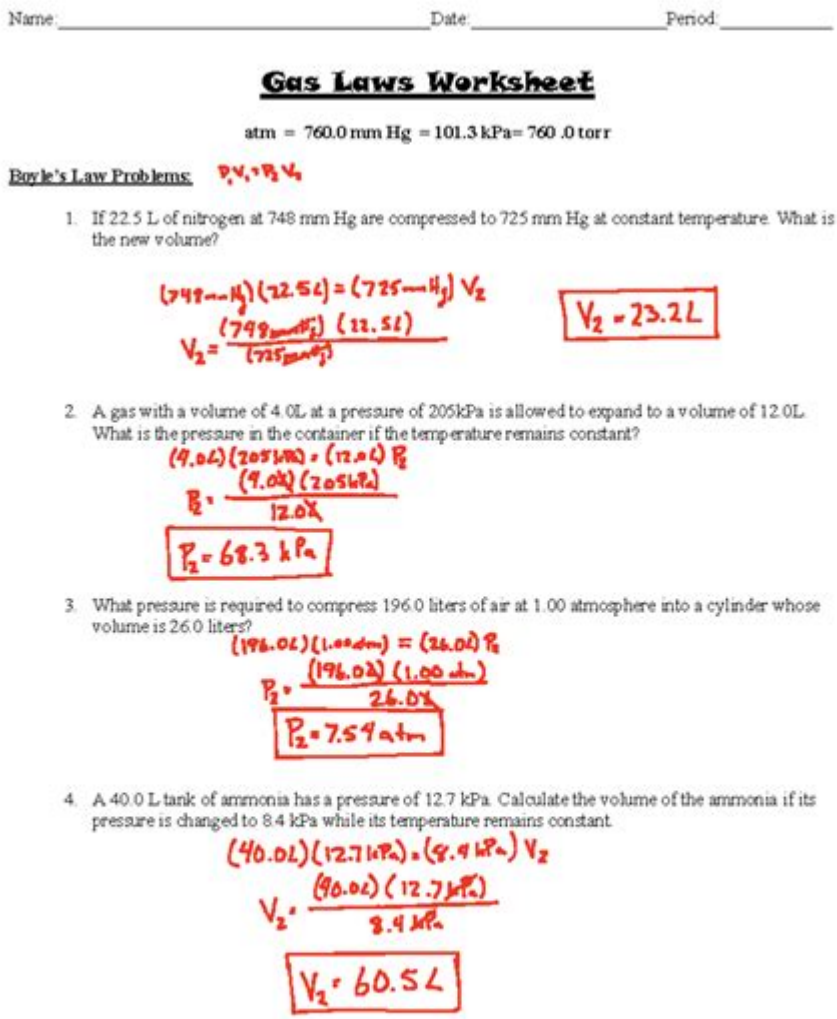
Gas Laws Review Sheet Answer Key



Name:_____Date:_____Period:_____

Gas Laws Worksheet

atm = 760.0 mm Hg = 101.3 kPa= 760 .0 torr

Boyle's Law Problems: $P_1V_1 = P_2V_2$

1. If 22.5 L of nitrogen at 748 mm Hg are compressed to 725 mm Hg at constant temperature. What is the new volume?

$(748\ mm\ Hg)(22.5\ L) = (725\ mm\ Hg)\ V_2$

$V_2 = \frac{(748\ mm\ Hg)(22.5\ L)}{(725\ mm\ Hg)}$

$V_2 = 23.2\ L$

2. A gas with a volume of 4.0L at a pressure of 205kPa is allowed to expand to a volume of 12.0L. What is the pressure in the container if the temperature remains constant?

$(4.0\ L)(205\ kPa) = (12.0\ L)\ P_2$

$P_2 = \frac{(4.0\ L)(205\ kPa)}{12.0\ L}$

$P_2 = 68.3\ kPa$

3. What pressure is required to compress 196.0 liters of air at 1.00 atmosphere into a cylinder whose volume is 26.0 liters?

$(196.0\ L)(1.00\ atm) = (26.0\ L)\ P_2$

$P_2 = \frac{(196.0\ L)(1.00\ atm)}{26.0\ L}$

$P_2 = 7.54\ atm$

4. A 40.0 L tank of ammonia has a pressure of 12.7 kPa. Calculate the volume of the ammonia if its pressure is changed to 8.4 kPa while its temperature remains constant.

$(40.0\ L)(12.7\ kPa) = (8.4\ kPa)\ V_2$

$V_2 = \frac{(40.0\ L)(12.7\ kPa)}{8.4\ kPa}$

$V_2 = 60.5\ L$

Gas laws review sheet answer key is an essential tool for students and educators alike, providing a comprehensive overview of the fundamental principles governing the behavior of gases. Understanding gas laws is pivotal in fields such as chemistry, physics, and engineering. This article delves into the key concepts of gas laws, explaining their significance, applications, and how to effectively use a review sheet as an answer key for studying and reinforcing knowledge.

Overview of Gas Laws

Gas laws describe the relationships between the pressure, volume, temperature, and amount of gas. The foundational laws include Boyle's Law, Charles's Law, Avogadro's Law, and the Ideal Gas Law. Each law offers insight into how gases behave under different conditions.

Boyle's Law

Boyle's Law states that the pressure of a gas is inversely proportional to its volume when the temperature and the amount of gas are held constant. This relationship can be mathematically expressed as:

$$ P_1V_1 = P_2V_2 $$

- Key Points:
- If the volume increases, the pressure decreases and vice versa.
- Applications include syringes and breathing mechanisms.

Charles's Law

Charles's Law states that the volume of a gas is directly proportional to its absolute temperature when the pressure and the amount of gas are constant. It can be expressed with the formula:

$$ \frac{V_1}{T_1} = \frac{V_2}{T_2} $$

- Key Points:
- As temperature increases, volume increases.
- Important in understanding the behavior of hot air balloons.

Avogadro's Law

Avogadro's Law states that equal volumes of gases, at the same temperature and pressure, contain an equal number of molecules. This can be represented as:

$$ V_1/n_1 = V_2/n_2 $$

- Key Points:
- Emphasizes the relationship between the amount of gas (in moles) and its volume.
- Used in stoichiometry and gas calculations.

The Ideal Gas Law

The Ideal Gas Law combines the three previous laws into a single equation that describes the state of an ideal gas. The law is represented as:

$$ PV = nRT $$

Where:
- $ P $ = Pressure
- $ V $ = Volume
- $ n $ = Number of moles

- R = Ideal gas constant
- T = Absolute temperature

- Key Points:
- This law is applicable under ideal conditions (high temperature and low pressure).
- It is pivotal in calculations involving gas mixtures and reactions.

Using a Gas Laws Review Sheet

A gas laws review sheet is a concise document that summarizes the key principles, equations, and constants associated with gas behavior. An answer key for this review sheet is vital for students to verify their understanding and mastery of the material.

Components of a Gas Laws Review Sheet

1. Key Formulas:
- Provide all relevant equations, such as those for Boyle's, Charles's, Avogadro's, and the Ideal Gas Law.

2. Definitions:
- Include definitions of important terms like pressure, volume, temperature, and moles.

3. Graphical Representations:
- Visual aids such as graphs showing the relationships described by each law can enhance understanding.

4. Sample Problems:
- Include example problems with solutions to illustrate how to apply the gas laws.

5. Constants and Units:
- List the ideal gas constant (R) and its units, along with other necessary conversion factors.

Sample Problems and Solutions

1. Boyle's Law Example:
- A gas has a volume of 4.0 L at a pressure of 2.0 atm. What will be the pressure if the volume is changed to 2.0 L?
- Solution:
$$P_1V_1 = P_2V_2$$
$$(2.0 \, \text{atm})(4.0 \, \text{L}) = P_2(2.0 \, \text{L})$$
$$P_2 = 4.0 \, \text{atm}$$

2. Charles's Law Example:
- A gas occupies 3.0 L at 300 K. What will be its volume at 600 K?
- Solution:

$$ \frac{V_1}{T_1} = \frac{V_2}{T_2} $$
$$ \frac{3.0 \, \text{L}}{300 \, \text{K}} = \frac{V_2}{600 \, \text{K}} $$
$$ V_2 = 6.0 \, \text{L} $$

3. Avogadro's Law Example:
- If 2.0 moles of gas occupy 22.4 L, how many liters will 4.0 moles occupy?
- Solution:
$$ V_1/n_1 = V_2/n_2 $$
$$ \frac{22.4 \, \text{L}}{2.0 \, \text{moles}} = \frac{V_2}{4.0 \, \text{moles}} $$
$$ V_2 = 44.8 \, \text{L} $$

4. Ideal Gas Law Example:
- Calculate the pressure of 1.0 mole of an ideal gas in a 22.4 L container at 273 K.
- Solution:
$$ PV = nRT $$
$$ P = \frac{nRT}{V} $$
$$ P = \frac{(1.0 \, \text{mol})(0.0821 \, \text{L atm/mol K})(273 \, \text{K})}{22.4 \, \text{L}} $$
$$ P \approx 1.0 \, \text{atm} $$

Conclusion

The gas laws review sheet answer key serves as a vital resource for mastering the principles of gas behavior. By consolidating essential formulas, definitions, and examples into a single document, students can enhance their understanding and problem-solving skills related to gases. Mastery of these concepts is not only crucial for academic success but also has practical applications in various scientific and industrial fields. With diligent study and the use of review sheets, learners can confidently tackle gas law problems and apply this knowledge effectively in real-world scenarios.

Frequently Asked Questions

What are the primary gas laws covered in a typical gas laws review sheet?

The primary gas laws included are Boyle's Law, Charles's Law, Avogadro's Law, and the Ideal Gas Law.

How can Boyle's Law be summarized in terms of pressure and volume?

Boyle's Law states that at constant temperature, the pressure of a gas is inversely proportional to its volume.

What formula represents Charles's Law?

Charles's Law can be represented by the formula V1/T1 = V2/T2, where V is volume and T is temperature in Kelvin.

What is Avogadro's Law and its significance?

Avogadro's Law states that equal volumes of gases at the same temperature and pressure contain an equal number of molecules, which is significant for understanding gas behavior.

What is the Ideal Gas Law equation?

The Ideal Gas Law is represented by the equation PV = nRT, where P is pressure, V is volume, n is the number of moles, R is the ideal gas constant, and T is temperature.

How do you calculate the number of moles in the Ideal Gas Law?

To calculate the number of moles (n) in the Ideal Gas Law, you can rearrange the equation to n = PV / RT.

What conditions are assumed when using the Ideal Gas Law?

The Ideal Gas Law assumes that the gas behaves ideally, meaning it has negligible volume and no intermolecular forces, typically at high temperature and low pressure.

What is the significance of the gas constant (R) in the Ideal Gas Law?

The gas constant (R) relates the energy scale to the temperature scale in the Ideal Gas Law and has different values depending on the units used.

How can you determine if a gas behaves ideally?

A gas is considered to behave ideally if it follows the Ideal Gas Law closely, especially under conditions of high temperature and low pressure.
