

# G Tube Nursing Assessment

## ACTIVE LEARNING TEMPLATE: *Nursing Skill*

STUDENT NAME: Cheyenne Tawzer

SKILL NAME: Gastrostomy feeding

REVIEW MODULE CHAPTER

### Description of Skill

A special tube in your child's stomach that helps deliver food and medicines until the child can chew and swallow.

### Indications

Birth defects of the mouth, esophagus, or stomach.

Unable to swallow normally

Inadequate oral nutrition

### CONSIDERATIONS

#### Nursing Interventions (pre, intra, post)

Make feed or use appropriate pre-made feed  
Check the expiry date of the feed  
Ensure patient is sitting up or elevated 30 degrees  
Flush g-tube with approx. 10 ML of warm water  
Connect the tubing onto the feed  
Prime the tubing  
Set the rate and the total volume of feed to be delivered  
Release clamps and deliver feeding  
Once feeding is delivered flush with 10 ml of sterile water

### Outcomes/Evaluation

Distention, nausea, or vomiting relieved/prevented  
Feeding and/or nutrition provided  
patient is comfortable, tube functioning properly

### Client Education

Education parents on s/s of dehydration  
Teach oral and dental care  
Education on skin care  
Education on tube care  
Emotional support

### Potential Complications

Diarrhea  
Constipation  
Dehydration  
Fluid overload  
Aspiration  
Clogged tube  
Leaking at the site  
Tube accidentally removed  
Site is irritated

### Nursing Interventions

Rinse the mouth with water for dryness.  
Provide oral hygiene frequently.  
Irrigate the tube per facility protocol to unclog blockages. Use tap water with enteral feedings.  
Have the client change position in case the tube is against the stomach wall.

G tube nursing assessment is a critical component of patient care for individuals who are unable to meet their nutritional needs through oral intake. Gastrostomy tubes, commonly referred to as G tubes, provide a direct route for nutrition, hydration, and medication administration into the stomach. Proper assessment and management of G tubes are essential to prevent complications and ensure optimal nutrition delivery. In this article, we will explore the various aspects of G tube nursing assessment, covering the importance of assessment, techniques, potential complications, and best practices for care.

## Importance of G Tube Nursing Assessment

Assessing a G tube is vital for several reasons:

1. **Prevent Complications:** Regular assessments can identify potential complications early, such as infection, tube displacement, or blockage.
2. **Ensure Proper Functioning:** An effective assessment helps ensure that the G tube is functioning as intended and delivering the required nutrition.
3. **Maintain Patient Comfort:** Regular checks help in addressing issues that may cause discomfort to the patient, such as irritation or leakage.
4. **Documentation and Communication:** Accurate assessments provide necessary documentation for health records and facilitate communication among the healthcare team.

## **Components of G Tube Nursing Assessment**

A comprehensive G tube nursing assessment involves several key components, each contributing to the overall evaluation of the tube's condition and the patient's health status.

### **1. Inspection of the Insertion Site**

The insertion site requires careful visual examination for any signs of complications. During this assessment, nurses should look for:

- **Redness or Inflammation:** Indicates potential infection or irritation.
- **Swelling or Edema:** May suggest an allergic reaction or infection.
- **Drainage:** Purulent or foul-smelling drainage can indicate infection.
- **Necrosis:** Tissue breakdown around the site may require immediate attention.

### **2. Palpation of the G Tube and Surrounding Area**

Palpation helps assess the integrity of the G tube and the tissues around it. Key points include:

- **Tube Placement:** Ensure the tube is securely in place and has not moved from its original position.
- **Tenderness:** Check for tenderness around the insertion site, which may indicate an underlying issue.
- **Firmness:** Abnormal firmness may suggest infection or fluid accumulation.

### **3. Assessment of Tube Patency**

Ensuring that the G tube is patent (open and unobstructed) is essential for effective feeding. Nurses should:

- **Flush the Tube:** Use a syringe to flush the tube with sterile water, checking for resistance or blockage.
- **Check Residuals:** Before feeding, measure gastric residual volumes to ensure the stomach can tolerate additional nutrition. A common practice is to check residuals every 4 to 6 hours in continuous feeding or before each intermittent feeding.

# Feeding Assessment

The feeding assessment is an integral part of the G tube nursing assessment. This includes evaluating the type of formula being used, the rate of administration, and the patient's tolerance to feeds.

## 1. Review of Feeding Orders

- Type of Formula: Confirm that the correct nutritional formula is being used based on the patient's needs.
- Rate of Administration: Ensure that the feeding rate aligns with physician orders and the patient's tolerance.
- Schedule: Verify that feeding schedules are being adhered to, including any breaks or pauses if necessary.

## 2. Monitoring Patient Tolerance

Patient tolerance to G tube feeding is crucial for successful nutritional support. Nurses should:

- Observe for Symptoms: Look for signs of intolerance such as nausea, vomiting, abdominal distension, or diarrhea.
- Adjust Feeding Rates: If intolerance occurs, consider slowing the feeding rate or holding the feed as necessary.
- Document Findings: Record any signs of intolerance and actions taken for future reference and care adjustments.

# Potential Complications and Their Management

G tube nursing assessments must also include awareness of potential complications and their management.

## 1. Infection

Infections can occur at the insertion site or internally. To manage and prevent infections:

- Maintain Cleanliness: Wash hands before and after handling the G tube.
- Use Sterile Techniques: When changing dressings or accessing the tube, use sterile gloves and equipment.
- Monitor for Signs of Infection: Look for increased redness, warmth, or drainage at the site.

## 2. Tube Displacement

Tube displacement can lead to aspiration or feeding into the wrong location. To identify and manage this:

- Check Placement: Use pH testing or auscultation (if appropriate) to confirm that the tube is in the correct position before administering feeds.
- Secure the Tube: Ensure that the tube is properly secured to prevent movement.

## 3. Blockage

Blocked G tubes can prevent feeding and require prompt intervention. Management includes:

- Flushing: Regularly flush the tube with sterile water to prevent blockages.
- Use of Enzymatic Solutions: If a blockage occurs, consider using enzymatic solutions to dissolve any clogging.

## Documentation and Communication

Effective documentation and communication are essential components of G tube nursing assessment. Nurses should:

- Document Findings: Record all assessment findings, feeding volumes, residuals, and any complications noted during the assessment.
- Communicate with the Healthcare Team: Share relevant information with other healthcare providers to ensure coordinated care and timely interventions.

## Best Practices for G Tube Care

Implementing best practices in G tube care is essential for preventing complications and promoting patient safety. These practices include:

- Education: Provide education to patients and caregivers about G tube care, including how to recognize signs of complications.
- Regular Assessments: Conduct regular assessments to monitor the condition of the G tube and the patient's nutritional status.
- Hydration: Ensure adequate hydration through regular flushing of the tube and administration of water as needed.

In conclusion, G tube nursing assessment is a multifaceted process that plays a crucial role in the care of patients requiring enteral feeding. By conducting thorough assessments, monitoring for complications, and adhering to best practices, nurses can ensure effective G tube management, promote patient comfort, and enhance overall health outcomes. Regular assessments, effective communication, and education are paramount in providing high-quality care for patients with G tubes.

# **Frequently Asked Questions**

## **What is a G-tube and why is it used?**

A G-tube, or gastrostomy tube, is a feeding tube placed directly into the stomach through the abdominal wall. It is used for patients who cannot eat by mouth due to various medical conditions, such as neurological disorders, swallowing difficulties, or chronic illness.

## **What are the key components of a G-tube nursing assessment?**

Key components include checking the insertion site for signs of infection or irritation, ensuring the tube is patent (not clogged), verifying tube placement, assessing the patient's nutritional needs, and monitoring for complications such as aspiration or leakage.

## **How should a nurse assess the G-tube insertion site?**

The nurse should inspect the insertion site for redness, swelling, drainage, or abnormal odor. Palpation may also be performed to check for tenderness or signs of infection.

## **What should be done if the G-tube appears to be clogged?**

If the G-tube is clogged, the nurse should attempt to flush it with warm water using a syringe. If the clog persists, enzymatic de-clogging agents may be used, but medical advice should be sought if the problem continues.

## **How often should a G-tube be assessed?**

A G-tube should be assessed daily or more frequently if there are concerns, such as signs of infection or complications. Regular assessments are crucial for ensuring proper function and patient safety.

## **What signs indicate that a patient may be experiencing a complication related to their G-tube?**

Signs of complications may include abdominal pain, vomiting, fever, signs of dehydration, changes in the color or consistency of drainage, or difficulty with feeding.

## **What is the importance of verifying G-tube placement before feeding?**

Verifying G-tube placement is crucial to prevent aspiration, which can lead to serious respiratory complications. This can be done by checking the pH of gastric contents or using imaging studies if necessary.

## **What patient education should be provided regarding G-tube care?**

Patients and caregivers should be educated on how to care for the G-tube, including how to clean the insertion site, signs of infection to watch for, how to manage feedings, and when to seek medical

help.
