Click on the Width icon to open the measuring tool at the bottom of the container.

1) What unit of measurement is used to measure the width of the container? nanometers

Click on the Particles icon. Use the gas pump to add one pump of particles to the container.

2) What type of particles (**heavy** or **light**) were added to the container? heavy

The handle on the side of the container can be moved to change the volume.
Drag the handle to change the volume of the container to a much smaller size.

6) What happens to the pressure in the container when the volume decreases?

The pressure in the container increases when the volume decreases.

Now drag the handle to change the volume of the container to a larger size.

7) What happens to the pressure in the container when the volume increases?

The pressure in the container decreases when the volume increases.

Gas laws Phet simulation answer key is a valuable resource for students and educators alike, especially for those delving into the world of chemistry. Understanding gas laws is crucial for grasping the behavior of gases under various conditions. The PhET Interactive Simulations project, developed by the University of Colorado Boulder, offers engaging simulations that simplify complex scientific concepts. This article will explore the gas laws, how the PhET simulation aids learning, and provide an answer key to help navigate the simulation effectively.

Understanding Gas Laws

Gas laws describe the relationships between pressure, volume, temperature, and the number of gas molecules. Here are the four primary gas laws that students must understand:

1. Boyle's Law

Boyle's Law states that the pressure of a gas is inversely proportional to its volume when the temperature is held constant. Mathematically, this can be expressed as:

$$ P_1 V_1 = P_2 V_2 $$

Where:
- P_1 and P_2 are the initial and final pressures, respectively.
- V_1 and V_2 are the initial and final volumes, respectively.

2. Charles's Law

Charles's Law states that the volume of a gas is directly proportional to its temperature (in Kelvin) when pressure is held constant. This relationship can be expressed as:

$$ \frac{V_1}{T_1} = \frac{V_2}{T_2} $$

Where:
- V_1 and V_2 are the initial and final volumes.
- T_1 and T_2 are the initial and final temperatures in Kelvin.

3. Gay-Lussac's Law

Gay-Lussac's Law states that the pressure of a gas is directly proportional to its absolute temperature when the volume is constant. The equation can be written as:

$$ \frac{P_1}{T_1} = \frac{P_2}{T_2} $$

Where:

- P_1 and P_2 are the initial and final pressures.
- T_1 and T_2 are the initial and final temperatures in Kelvin.

4. Ideal Gas Law

The Ideal Gas Law combines the previous laws into a single equation that relates pressure, volume, temperature, and the number of moles of gas:

$$PV = nRT$$

Where:

- P is the pressure of the gas,
- V is the volume,
- n is the number of moles,
- R is the universal gas constant, and
- T is the absolute temperature in Kelvin.
