Prior Knowledge Questions (Do these BEFORE using the Gizmo.)

The **peppered moth** (*Biston betularia*) is a common moth found in Europe, Asia, and North America. It is commonly found in two forms, or **morphs**: a dark morph and a light, speckled morph. Birds are a frequent predator of the peppered moth.

1. Which morph do you think would be easier to see on a dark tree trunk? A lighter color moth
2. Which morph do you think would be easier to see on a light tree trunk? A dark colored moth

The *Natural Selection* Gizmo allows you to play the role of a bird feeding on peppered moths. The initial population of 40 moths is scattered over 20 tree trunks. Click on moths to capture them. Click the **Next tree** button (or the **spacebar** on your keyboard) to advance to the next tree.

How many moths can you find?

1. Check that LIGHT TREES is selected. Click **Play** ( ), and hunt moths for one year.
   A. How many dark moths did you capture? 10
   B. How many light moths did you capture? 11
   C. **Camouflage** is coloring or patterns that help an organism to blend in with the background. Which type of moth is better camouflaged on light bark? light colored moth
2. If a forest contained mostly light-colored trees, which type of moth would you expect to be most common?

I would think that the light colored moth is the most common in lighter colored trees.

Gizmos Student Exploration Natural Selection Answer Key is a valuable resource for educators and students who want to deepen their understanding of the principles of natural selection. Gizmos, an interactive online learning platform, provides simulations and activities that help students visualize and experiment with scientific concepts. In this article, we will explore the significance of natural selection, how Gizmos facilitates student exploration in this area, and provide insights into the answer key related to the natural selection module.

Understanding Natural Selection

Natural selection is a fundamental mechanism of evolution, proposed by Charles Darwin in the 19th

century. It explains how species adapt to their environment over time through the following key processes:

1. Variation: Within a population, individuals exhibit variations in traits, such as size, color, and behavior.
2. Competition: Organisms compete for limited resources, including food, mates, and shelter.
3. Survival of the Fittest: Individuals with traits that provide a competitive advantage are more likely to survive and reproduce.
4. Inheritance: Favorable traits are passed on to the next generation, leading to gradual changes in the population.

Understanding natural selection is crucial for students as it lays the foundation for concepts in genetics, ecology, and evolutionary biology.
