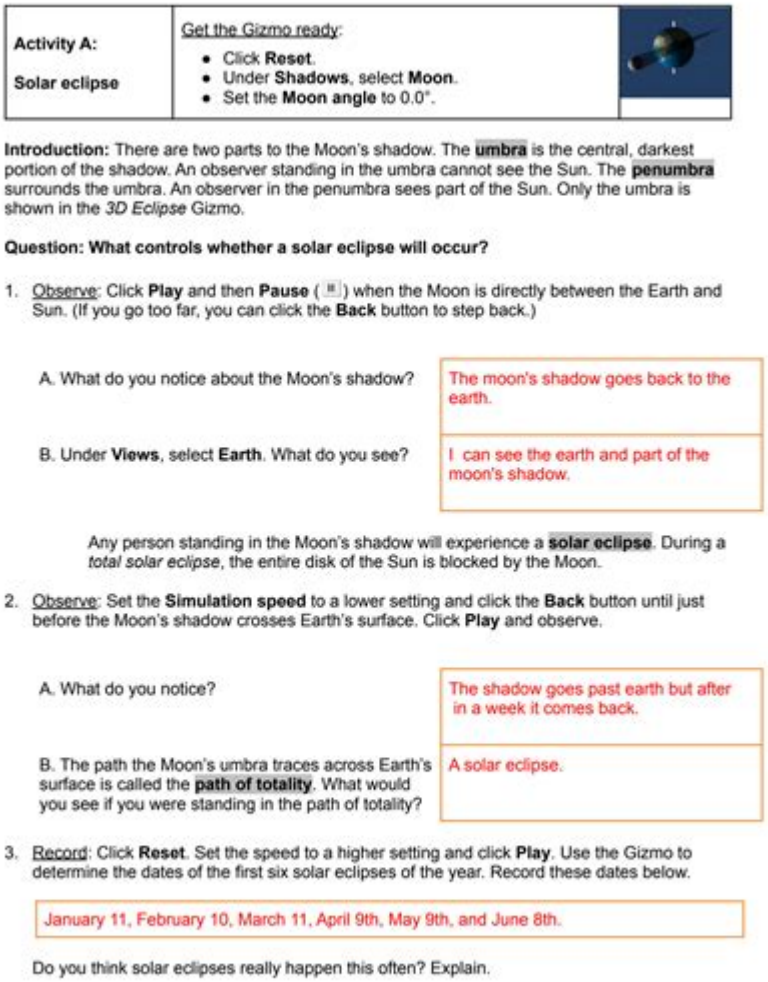
Gizmos Answer Key



Activity A: Solar eclipse	Get the Gizmo ready: • Click **Reset**. • Under **Shadows**, select **Moon**. • Set the **Moon angle** to 0.0°.

Introduction: There are two parts to the Moon's shadow. The **umbra** is the central, darkest portion of the shadow. An observer standing in the umbra cannot see the Sun. The **penumbra** surrounds the umbra. An observer in the penumbra sees part of the Sun. Only the umbra is shown in the *3D Eclipse* Gizmo.

Question: What controls whether a solar eclipse will occur?

1. Observe: Click **Play** and then **Pause** ( ) when the Moon is directly between the Earth and Sun. (If you go too far, you can click the **Back** button to step back.)

A. What do you notice about the Moon's shadow?	The moon's shadow goes back to the earth.
B. Under **Views**, select **Earth**. What do you see?	I can see the earth and part of the moon's shadow.

Any person standing in the Moon's shadow will experience a **solar eclipse**. During a *total solar eclipse*, the entire disk of the Sun is blocked by the Moon.

2. Observe: Set the **Simulation speed** to a lower setting and click the **Back** button until just before the Moon's shadow crosses Earth's surface. Click **Play** and observe.

A. What do you notice?	The shadow goes past earth but after in a week it comes back.
B. The path the Moon's umbra traces across Earth's surface is called the **path of totality**. What would you see if you were standing in the path of totality?	A solar eclipse.

3. Record: Click **Reset**. Set the speed to a higher setting and click **Play**. Use the Gizmo to determine the dates of the first six solar eclipses of the year. Record these dates below.

January 11, February 10, March 11, April 9th, May 9th, and June 8th.

Do you think solar eclipses really happen this often? Explain.
