Ideal Gas Law Worksheet PV = nRT

Use the ideal gas law, "PerV-nRT", and the universal gas constant $R = 0.0821 \frac{L*atm}{K*mol}$ to solve the following problems:
If pressure is needed in kPa then convert by multiplying by *101.3kPa / 1atm* to get
$R = 8.31\ kPa*L/(K*mole)$

1) If I have 4 moles of a gas at a pressure of 5.6 atm and a volume of 12 liters, what is the temperature?

PV=nRT

$T = \frac{PV}{nR} = \frac{(5.6atm)(12L)}{4mol \cdot 0.0821 \frac{L \cdot atm}{mol \cdot K}}$

T = 204.63 K

2) If I have an unknown quantity of gas at a pressure of 1.2 atm, a volume of 31 liters, and a temperature of 87 °C, how many moles of gas do I have?

PV=nRT

$n = \frac{PV}{RT} = \frac{1.2atm \cdot 31L}{0.0821 \frac{L \cdot atm}{mol \cdot K} \cdot 360K}$

n = 1.2586 mol

3) If I contain 3 moles of gas in a container with a volume of 60 liters and at a temperature of 400 K, what is the pressure inside the container?

PV=nRT

$P = \frac{nRT}{V} = \frac{3mol \cdot 0.0821 \frac{L \cdot atm}{mol \cdot K} \cdot 400K}{60L}$

P = 1.642 atm or P = 166.29 kPa

4) If I have 7.7 moles of gas at a pressure of 0.09 atm and at a temperature of 56 °C, what is the volume of the container that the gas is in?

PV=nRT

$V = \frac{nRT}{P} = \frac{7.7mol \cdot 0.0821 \frac{L \cdot atm}{mol \cdot K} \cdot 329K}{0.09atm}$

V = 2310.93 L

5) If I have 17 moles of gas at a temperature of 67 °C, and a volume of 88.89 liters, what is the pressure of the gas?

PV=nRT

$P = \frac{nRT}{V} = \frac{17mol \cdot 0.0821 \frac{L \cdot atm}{mol \cdot K} \cdot 340K}{88.89L}$

P = 5.34 atm or P = 540.61 kPa

6) If I have an unknown quantity of gas at a pressure of 0.5 atm, a volume of 25 liters, and a temperature of 300 K, how many moles of gas do I have?

PV=nRT

$n = \frac{PV}{RT} = \frac{0.5atm \cdot 25L}{0.0821 \frac{L \cdot atm}{mol \cdot K} \cdot 300K}$

n = 0.5075 mol

Ideal gas law worksheet is an essential educational tool that aids students and educators in understanding the principles of gases and their behavior under various conditions. The ideal gas law, represented by the equation PV = nRT, is fundamental in the study of chemistry and physics. This article will explore the ideal gas law, its components, applications, and how to effectively use worksheets to enhance learning and assessment.

Understanding the Ideal Gas Law

The ideal gas law is a mathematical relationship that describes the behavior of an ideal gas. It combines several earlier gas laws and provides a convenient way to calculate the state of a gas when certain variables are

known.

Components of the Ideal Gas Law

The ideal gas law can be expressed through the formula:

$$ PV = nRT $$

Where:

- P = Pressure of the gas (usually in atmospheres or pascals)
- V = Volume of the gas (in liters or cubic meters)
- n = Number of moles of the gas
- R = Ideal gas constant (0.0821 L·atm/(K·mol) or 8.314 J/(K·mol))
- T = Temperature in Kelvin

Each variable plays a crucial role in determining the behavior of an ideal gas:

1. Pressure (P): The force exerted by the gas molecules colliding with the walls of its container. It is influenced by the number of particles and temperature.

2. Volume (V): The space that the gas occupies. Changes in volume can significantly affect the pressure and temperature of the gas.

3. Number of Moles (n): This represents the amount of gas present. It is directly proportional to the number of particles in the gas.

4. Temperature (T): The average kinetic energy of the gas particles, measured in Kelvin. An increase in temperature typically leads to increased pressure or volume.

5. Ideal Gas Constant (R): A proportionality constant that connects the units of pressure, volume, temperature, and moles.

Assumptions of the Ideal Gas Law

The ideal gas law is based on several assumptions about gas behavior:

- Gases consist of a large number of molecules that are in constant random motion.
- The volume of the gas molecules is negligible compared to the volume of the container.
- There are no intermolecular forces acting between the gas molecules.
- Collisions between gas molecules and with the walls of the container are perfectly elastic.

While real gases do not always behave ideally, the ideal gas law provides a good approximation under many conditions, particularly at high temperatures and low pressures.

Applications of the Ideal Gas Law

The ideal gas law has numerous applications in various scientific fields, including:

1. Calculating Gas Properties: It allows scientists to predict how gases will behave when conditions change. For example, if the pressure of a gas increases while the temperature remains constant, the volume must decrease.

2. Stoichiometry in Reactions: The ideal gas law is used in calculating the amount of gas produced or consumed in chemical reactions. This is especially useful in reactions that produce gases, such as combustion.

3. Industrial Applications: Industries utilize the ideal gas law to design equipment and processes involving gases, such as reactors, compressors, and storage tanks.

4. Meteorology: Understanding the behavior of atmospheric gases helps meteorologists predict weather patterns and phenomena.

5. Engineering: The ideal gas law is applied in various engineering fields, particularly in thermodynamics, fluid mechanics, and chemical engineering.
