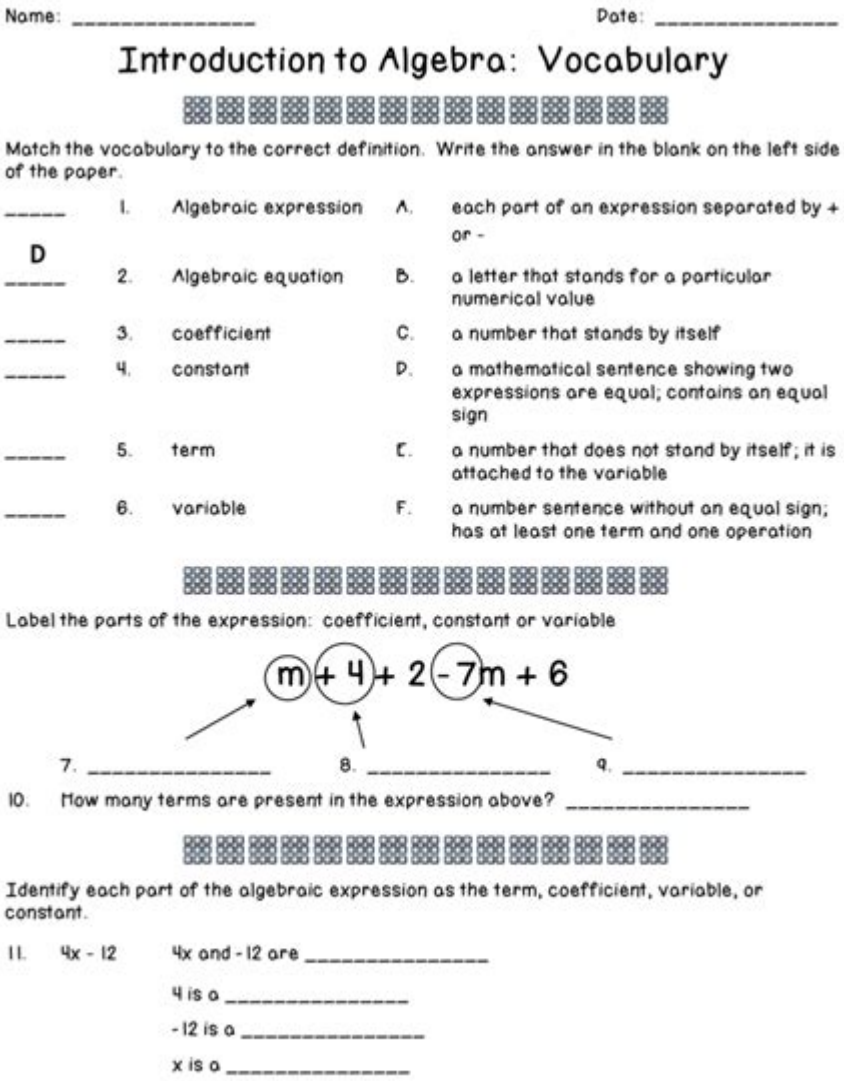
Introduction To Algebra Vocabulary



Name: _____ Date: _____

Introduction to Algebra: Vocabulary

Match the vocabulary to the correct definition. Write the answer in the blank on the left side of the paper.

_____	1.	Algebraic expression	A.	each part of an expression separated by + or -
D				
_____	2.	Algebraic equation	B.	a letter that stands for a particular numerical value
_____	3.	coefficient	C.	a number that stands by itself
_____	4.	constant	D.	a mathematical sentence showing two expressions are equal; contains an equal sign
_____	5.	term	E.	a number that does not stand by itself; it is attached to the variable
_____	6.	variable	F.	a number sentence without an equal sign; has at least one term and one operation

Label the parts of the expression: coefficient, constant or variable

m + 4 + 2 - 7m + 6

7. _____ 8. _____ 9. _____

10. How many terms are present in the expression above? _____

Identify each part of the algebraic expression as the term, coefficient, variable, or constant.

11. 4x - 12

4x and -12 are _____

4 is a _____

-12 is a _____

x is a _____

Introduction to Algebra Vocabulary

Algebra is a branch of mathematics that deals with symbols and the rules for manipulating those symbols. It is fundamental to many areas of mathematics and science and serves as a powerful tool for problem-solving. Understanding algebra vocabulary is crucial for mastering the concepts and performing calculations effectively. This article will introduce essential algebra vocabulary, breaking down terms into easily digestible sections and providing examples to enhance comprehension.

What is Algebra?

Algebra can be defined as the study of mathematical symbols and the rules for manipulating these symbols. It extends arithmetic by introducing variables, which are symbols that represent numbers.

Algebra allows for the formulation of equations and expressions, enabling the solving of problems in a generalized way.

Key components of algebra include:

1. Variables: Symbols that represent unknown values.
2. Constants: Fixed values that do not change.
3. Coefficients: Numbers that multiply the variables in an expression.
4. Expressions: Combinations of variables, constants, and operators (like +, -, , /).
5. Equations: Statements that two expressions are equal, often containing an equals sign (=).

Fundamental Algebra Vocabulary

To communicate effectively in algebra, one must become familiar with basic vocabulary. Below are some essential terms:

1. Variable

A variable is a letter or symbol that represents a number that can change. Common variables include x, y, and z. For example, in the expression $2x + 3$, x is the variable.

2. Constant

A constant is a fixed value that does not change. For example, in the expression $5x + 3$, the number 3 is a constant.

3. Coefficient

A coefficient is a numerical factor in a term. In the expression $4x^2$, the coefficient is 4, which multiplies the variable x^2.

4. Term

A term is a single mathematical expression that can be a constant, variable, or the product of both. For example, in the expression $2x + 3y - 7$, the terms are $2x$, $3y$, and -7.

5. Expression

An expression is a combination of terms that can include variables, constants, and operators but does

not have an equals sign. For example, $3x + 7$ is an expression.

6. Equation

An equation is a mathematical statement that asserts the equality of two expressions, typically featuring an equals sign. For example, $3x + 5 = 11$ is an equation.

7. Inequality

An inequality is a mathematical statement that compares two expressions using inequality symbols, such as $<$, $>$, $\leq$, or $\geq$. For example, $x + 2 > 5$ indicates that $x + 2$ is greater than 5.

8. Function

A function is a relation that assigns exactly one output value for each input value. It is often expressed as $f(x)$, where f is the function name and x is the input. For example, $f(x) = 2x + 3$ defines a function where $2x + 3$ is the output for the input x.

9. Polynomial

A polynomial is a mathematical expression that consists of variables raised to whole number powers and coefficients. The general form is $a_nx^n + a_{n-1}x^{n-1} + \ldots + a_1x + a_0$, where a_n are coefficients and n is a non-negative integer. For example, $4x^3 - 2x^2 + x - 7$ is a polynomial.

10. Degree

The degree of a polynomial is the highest exponent of the variable in the expression. For example, in the polynomial $4x^3 - 2x^2 + x - 7$, the degree is 3.

11. Factor

To factor an expression means to break it down into simpler expressions that, when multiplied together, give the original expression. For example, the expression $x^2 - 9$ can be factored into $(x - 3)(x + 3)$.

12. Roots or Solutions

The roots (or solutions) of an equation are the values of the variable that make the equation true. For instance, in the equation $x^2 - 4 = 0$, the roots are $x = 2$ and $x = -2$.

Operations in Algebra

Understanding the operations that can be performed on algebraic expressions is essential. These operations include addition, subtraction, multiplication, and division. Here are some important algebraic operations:

1. Addition

Combining two or more expressions by adding their corresponding terms. For instance, $(2x + 3) + (4x - 5) = 6x - 2$.

2. Subtraction

Removing one expression from another. For example, $(5x + 7) - (2x + 3) = 3x + 4$.

3. Multiplication

Multiplying expressions involves distributing each term in one expression across each term in another. For instance, $(x + 2)(x + 3) = x^2 + 5x + 6$.

4. Division

Dividing one expression by another can be more complex, especially when dealing with polynomials. For example, $\frac{x^2 - 4}{x - 2} = x + 2$ (for $x \neq 2$).

Algebraic Properties

Several properties govern algebraic operations, making calculations consistent and predictable. Here are some key properties:

1. Commutative Property

This property states that the order of addition or multiplication does not affect the result:
- Addition: $a + b = b + a$
- Multiplication: $a \times b = b \times a$

2. Associative Property

This property indicates that the grouping of numbers does not change the result:
- Addition: $(a + b) + c = a + (b + c)$
- Multiplication: $(a \times b) \times c = a \times (b \times c)$

3. Distributive Property

The distributive property allows for the multiplication of a single term across an expression:
- $a(b + c) = ab + ac$

4. Identity Property

This property states that adding zero or multiplying by one will not change the value:
- Addition: $a + 0 = a$
- Multiplication: $a \times 1 = a$

Conclusion

Understanding algebra vocabulary is essential for anyone wishing to explore mathematics further. The terms introduced in this article provide a foundation for more advanced concepts and problem-solving techniques. As you continue to learn and practice algebra, familiarity with these terms will enhance your ability to communicate mathematical ideas clearly and accurately. With continued practice, the world of algebra will become an invaluable part of your mathematical toolkit.

Frequently Asked Questions

What is an 'algebraic expression'?

An algebraic expression is a mathematical phrase that includes numbers, variables, and operations (such as addition, subtraction, multiplication, and division).

What does the term 'variable' mean in algebra?

A variable is a symbol, often represented by letters like x or y, that stands for a number that can change or vary.

What is a 'coefficient'?

A coefficient is a numerical factor that multiplies a variable in an algebraic expression, such as 3 in the expression 3x.

What is the difference between 'equation' and 'expression'?

An expression is a combination of numbers and variables without an equality sign, while an equation states that two expressions are equal, using an equality sign.

What is meant by 'like terms'?

Like terms are terms that have the same variable raised to the same power, allowing them to be combined through addition or subtraction.

What is a 'constant' in algebra?

A constant is a fixed value that does not change, represented by a number on its own, such as 5 in the expression 3x + 5.

What does 'solving for x' mean?

Solving for x means finding the value of the variable x that makes the equation true.

What is a 'polynomial'?

A polynomial is an algebraic expression that consists of variables raised to whole number powers and their coefficients, such as 4x^2 + 3x - 5.

What is the 'distributive property'?

The distributive property states that a(b + c) = ab + ac, meaning you can multiply a number by a sum by distributing the multiplication across each addend.

What is 'factoring' in algebra?

Factoring is the process of breaking down an algebraic expression into a product of simpler expressions or factors.
