3. Graphical Problems:
- Students may be asked to analyze or interpret graphs related to light intensity, wavelength, or other optical properties.

Example Problems and Solutions

Here are a few examples of the types of problems and their solutions that can be found in this edition:

1. Problem: A ray of light strikes a glass surface at an angle of 30 degrees. What is the angle of refraction if the refractive index of glass is 1.5?
- Solution: Using Snell's law:
- $n1 \sin(\theta 1) = n2 \sin(\theta 2)$
- Assuming $n1$ (air) = 1.0, $n2$ (glass) = 1.5, and $\theta 1 = 30$ degrees:
- $1.0 \sin(30) = 1.5 \sin(\theta 2)$
- This leads to $\sin(\theta 2) = (0.5 / 1.5) = 0.333$, and thus $\theta 2 = \arcsin(0.333) \approx 19.5$ degrees.

2. Problem: Calculate the focal length of a concave lens with a radius of curvature of 20 cm.
- Solution: Using the lens maker's formula:
- $1/f = (n - 1) (1/R1 - 1/R2)$
- For a concave lens, R1 is negative, and R2 is positive:
- Assume $n = 1.5$, $R1 = -20$ cm, $R2 =$ [illegible] .
- Therefore, $1/f = (1.5 - 1) (1/(-20) - 1/$[illegible]$) = 0.5 (-1/20) = -0.025$, so $f = -40$ cm (the lens is diverging).

3. Problem: In Young's double-slit experiment, if the distance between the slits is 0.5 mm and the screen is 2 m away, calculate the distance between the first and second bright fringes for light of wavelength 500 nm.
- Solution: Using the formula for fringe spacing:
- $\Delta y = (\lambda L) / d$
- Here, $\lambda = 500$ nm = 500 x 10^-9 m, $L = 2$ m, and $d = 0.5 \times 10^{-3}$ m.
- $\Delta y = (500 \times 10^{-9} 2) / (0.5 \times 10^{-3}) = 0.002$ m or 2 mm.
