b If the population is normally distributed, the Empirical Rule is appropriate and the desired fraction is calculated. Referring to the normal distribution shown below, the fraction of area lying between 175 and 190 is 0.34, so that the fraction of colleges having more than 190 teachers is $0.5 - 0.34 = 0.16$.

2.78 We must estimate s and compare with the student's value of 0.263. In this case, $n = 20$ and the range is $R = 17.4 - 16.9 = 0.5$. The estimated value for s is then

$$s \approx R/4 = 0.5/4 = 0.125$$

which is less than 0.263. It is important to consider the magnitude of the difference between the "rule of thumb" and the calculated value. For example, if we were working with a standard deviation of 100, a difference of 0.142 would not be great. However, the student's calculation is twice as large as the estimated value. Moreover, two standard deviations, or $2(0.263) = 0.526$, already exceeds the range. Thus, the value $s = 0.263$ is probably incorrect. The correct value of s is

$$s = \sqrt{\frac{\sum x_i^2 - \frac{(\sum x_i)^2}{n}}{n-1}} = \sqrt{\frac{5851.95 - \frac{117032.41}{20}}{19}} = \sqrt{0.0173} = 0.132$$

2.79 Notice that two (Sosa and McGuire) of the four players have relatively symmetric distributions. The whiskers are the same length and the median line is close to the middle of the box. The variability of the distributions is similar for all four players, but Barry Bonds has a distribution with a long right whisker, meaning that there may be an unusually large number of homers during one of his seasons. The distribution for Babe Ruth is slightly different from the others. The median line to the right of middle indicates a distribution skewed to the left; that there were a few seasons in which his homerun total was unusually low. In fact, the median number of homeruns for the other three players are all about 34-35, while Babe Ruth's median number of homeruns is closer to 40.

2.80 **a** Use the information in the exercise. For 2001, $IQR = 16.5$, and the upper fence is

$$Q_3 + 1.5 IQR = 41.50 + 24.75 = 66.25$$

For 2006, $IQR = 20$, and the upper fence is

$$Q_3 + 1.5 IQR = 45.00 + 30.00 = 75.00$$

b The upper fence is different in 2006, so that the record number of homers, $x = 73$ is no longer an outlier, although it is still the most homers ever hit in a single season!

2.81 **a** Calculate $n = 50$, $\sum x_i = 418$, so that $\bar{x} = \frac{\sum x_i}{n} = \frac{418}{50} = 8.36$.

b The position of the median is $.5(n+1) = 25.5$ and $m = (4 + 4)/2 = 4$.

c Since the mean is larger than the median, the distribution is skewed to the right.

Introduction to Probability and Statistics 13th Edition is a comprehensive textbook that serves as a foundational resource for students and professionals interested in understanding the principles of probability and statistics. This edition, authored by William Mendenhall, Beaver, and Beaver, has been meticulously updated to reflect the latest advances in the field, making it an essential tool for both learning and application. As we delve into the contents and features of this edition, we will explore its structure, key concepts, applications, and the importance of mastering probability and statistics in various disciplines.

Understanding Probability

Probability is a branch of mathematics that deals with the likelihood of events occurring. It is fundamental for statistical analysis and decision-making processes in various fields, including economics, healthcare, engineering, and social sciences.

Basic Concepts of Probability

1. Experiment: An action or process that leads to one or more outcomes.
2. Sample Space (S): The set of all possible outcomes of an experiment.
3. Event: A subset of the sample space. An event may consist of one or more outcomes.
4. Probability of an Event (P): A measure of the likelihood that the event will occur, given by the ratio of the number of favorable outcomes to the total number of outcomes in the sample space.

Types of Probability

- Theoretical Probability: Based on reasoning and mathematical principles; for example, the probability of rolling a three on a fair six-sided die is $\frac{1}{6}$.
- Empirical Probability: Based on observed data; for instance, if a die is rolled 60 times and three comes up 10 times, the empirical probability of rolling a three is $\frac{10}{60} = \frac{1}{6}$.
- Subjective Probability: Based on personal judgment or experience rather than exact calculation.

Rules of Probability

1. Addition Rule: For any two mutually exclusive events A and B, the probability that A or B occurs is given by:
$$
P(A \cup B) = P(A) + P(B)
$$
2. Multiplication Rule: For two independent events A and B, the probability that both A and B occur is:
$$
P(A \cap B) = P(A) \times P(B)
$$

Understanding these fundamental concepts helps in grasping more complex topics that are covered later in the textbook.

Statistics: The Science of Data

Statistics is the science of collecting, analyzing, interpreting, presenting, and organizing data. It plays a crucial role in helping researchers and analysts make informed decisions based on empirical evidence.

Descriptive Statistics

Descriptive statistics summarize and describe the features of a dataset. Key concepts include:

- Measures of Central Tendency:
- Mean: The average of a dataset.
- Median: The middle value when the data is arranged in order.
- Mode: The most frequently occurring value in a dataset.

- Measures of Dispersion:
- Range: The difference between the highest and lowest values.
- Variance: A measure of how much values deviate from the mean.
- Standard Deviation: The square root of the variance, representing the average distance of each data point from the mean.

Inferential Statistics

Inferential statistics allows us to make predictions or inferences about a population based on sample data. This section covers:

- Sampling Methods: Techniques for selecting a subset of individuals from a population, including random sampling, stratified sampling, and cluster sampling.
- Hypothesis Testing: A method for testing claims about a population parameter. This includes formulating a null hypothesis (H0) and an alternative hypothesis (H1), determining the significance level (α), and calculating p-values.
- Confidence Intervals: A range of values used to estimate the true population parameter with a specified level of confidence.

Applications of Probability and Statistics

The principles of probability and statistics are widely applicable across various fields. Here are some of the key areas where these concepts are utilized:

Healthcare

- Clinical Trials: Probability and statistics are crucial in designing and analyzing clinical trials to determine the efficacy of new medications.
- Epidemiology: Understanding the spread and control of diseases relies heavily on statistical models and probability.

Business and Economics

- Market Research: Companies use statistical methods to analyze consumer behavior and preferences.
- Quality Control: Statistical process control helps in maintaining and improving product quality.

Social Sciences

- Surveys and Polls: Researchers utilize statistical methods to analyze survey data and draw conclusions about public opinion.
- Behavioral Studies: Probability helps in modeling human behavior and predicting outcomes based on various factors.

Engineering and Natural Sciences

- Reliability Engineering: Probability models are used to predict the reliability and failure rates of systems and components.
- Environmental Statistics: Statistical methods help in analyzing environmental data and assessing changes in ecosystems.
