Choosing the Proper Location

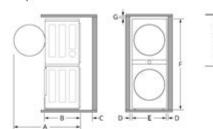

Check the following requirements for the install location before installing the appliance.

- · Allow for sufficient space between the walls and the appliance for installation.
- · Make sure that the floor is clean, dry and free of dust, dirt, water and oil so the leveling feet cannot slide easily. Leveling feet that can move or slide on the floor can contribute to excess vibration and noise.
- · If the floor has too much flex, reinforce it to make it more rigid. If the floor is not solid, it may cause severe vibration and noise.
- · If a drain pan must be used, take extra care to follow the instructions provided with the drain pan and make sure the leveling feet are adjusted for firm and even contact with the pan. Use of drain pans and failure to properly level the appliance may result in increased vibration and noise during operation.

- · To minimize noise and vibration, install the washer on a level, solidly constructed floor capable of supporting the appliance without flexing or bouncing.
- · The appliance must be installed on firm flooring to minimize vibration during the spin cycle. Concrete flooring is best, but a wood floor is sufficient, provided it is built to FHA standards.
- · The floor under the appliance must not slope more than 1 inch (2.5 cm) from front to back or side to side.
- · Installing on carpeting and soft tile surfaces is not recommended.
- · Never install the appliance on a platform or weakly supported structure.

Floor Installation

To ensure sufficient clearance for water inlet hoses, drain hose and airflow, allow minimum clearances of at least 1" (2.5 cm) at the sides and 4" (10 cm) behind the appliance. Be sure to allow for wall, door, or floor moldings that may increase the required clearances.
