Importance of Middle School Mathematics on High School Students' Mathematics Achievement

ABSTRACT **The authors explored the consequences of middle school mathematics course taking, a measure of opportunity to learn, disparity in students' high school mathematics achievement, and achievement growth. Using 4-year longitudinal data from an ethnically and linguistically diverse district, they applied a 3-level hierarchical linear growth model to address potential inequity in course taking and its consequences. The results indicate that course-taking patterns, even when controlling for prior achievement, play a prominent role in identifying performance differences. The distribution of mathematics course taking among various subgroups not only differed in Grade 8 but also became increasingly inequitable by Grade 11.**

Key words: mathematics achievement, mathematics course taking, opportunity to learn

Inequity in student course taking has become a national concern. Numerous research papers and government reports have established the link between disparity in students' course taking, and students' disparities of opportunity to learn (OTL) and achievement (e.g., Gamoran & Hannigan, 2000; Oakes, 1990; Raizen & Jones, 1985; Riley, 1997; Shakrani, 1996; Wang & Goldschmidt, 1999). Disparity in mathematics course taking and achievement has been documented widely for major disaggregates like gender and ethnicity (Catsambia, 1994; Jones, Daveport, Bryson, Bekhuis, & Zwick, 1986; Lee, Croninger, & Smith, 1997; McLure, Sun, & Valiga, 1997; Raizen & Jones, 1985; Wang & Goldschmidt, 1999). The researchers found that girls and underrepresented minorities, especially African Americans and Hispanics, tend to take fewer mathematics courses.

However, research on mathematics course-taking patterns overlooks students' English language proficiency and immigrant status. Disparity research typically has been concentrated on mathematics achievement by language proficiency and immigrant status—not on OTL by language proficiency and immigrant status. English language learners (ELL) consistently have had lower mathematics achievement scores than their non-ELL peers (Abedi & Lord, 2000; Cocking & Chipman, 1988; Mestre, 1988). Immigrant status affects students' mathematics performance mainly through their English language proficiency, socioeconomic status (SES), previous schooling, and so forth (Minicucci & Olsen, 1992). For example, students who are fluent in oral English may still be classified as ELL because they lack the basic academic reading and writing skills; immigrant students who are ELL because of their language proficiency could be proficient in subject matter that requires minimum language ability. In relation to those findings, language proficiency and immigrant status are the other two sources of unequal educational opportunities. Teachers may provide adequate content coverage for U.S.-born English speakers, but students with different language and cultural backgrounds may not benefit fully from the same instruction.

In this research, we focused on the disparity related to language proficiency and immigrant status to provide some insight into the consequences of students' mathematics course-taking disparity in middle school on their later mathematics achievement and achievement growth in high school. We examined the following three research questions:

1. Is the mathematics course-taking distribution in Grade 8 different by students' gender, ethnicity, immigrant and language proficiency status? And how is this distribution related to the mathematics course-taking distribution in Grade 11?
2. Do middle school course-taking patterns have any independently long-lasting effects on students beyond middle school achievement? If so, what are the effects on
