

Mechanical Engineering Sample Problems

PROBLEMS In INDUSTRIAL PLANT ENGINEERING

Part 1: Heat Transfer

1. Past ME Board Problem

Calculate the energy transfer rate across 6 in. wall of firebrick with a temperature difference across the wall of 50°C. The thermal conductivity of the firebrick is 0.65 Btu/hr-ft-°F at the temperature interest.

- A. 285 W/m²
B. 369 W/m²

- C. 112 W/m²
D. 429 W/m²

Solution

GIVEN:

$$x = 6 \text{ in}$$

$$\Delta T = 50^\circ\text{C}$$

$$k = 0.65 \frac{\text{Btu}}{\text{hr} \cdot \text{ft} \cdot ^\circ\text{F}}$$

$$Q = \frac{kA\Delta t}{x}$$

$$\frac{Q}{A} = \frac{k\Delta t}{x}$$

where:

$$\Delta t = 50 \left(\frac{9}{5} \right) = 90^\circ\text{F}$$

$$x = 6 \text{ in.} = 0.5 \text{ ft}$$

$$k = 0.65 \frac{\text{Btu}}{\text{hr} \cdot \text{ft} \cdot ^\circ\text{F}}$$

REQ'D:

$$Q/A$$

WRITE:

$$\frac{Q}{A} = \frac{k\Delta t}{x}$$

then:

$$\frac{Q}{A} = \frac{(0.65)(90)}{0.50} \frac{\text{Btu}}{\text{hr} \cdot \text{ft} \cdot ^\circ\text{F}}$$

$$\frac{Q}{A} = 117 \frac{\text{Btu}}{\text{hr} \cdot \text{ft}^2} \left(\frac{3.153 \text{ W/m}^2}{1 \text{ Btu/hr} \cdot \text{ft}^2} \right)$$

thus:

$$\therefore (A) \frac{Q}{A} = 368.90 \frac{\text{W}}{\text{m}^2}$$

Scanned with CamScanner

Mechanical engineering sample problems provide a practical approach to understanding the concepts and applications in the field. They serve as valuable tools for students and professionals alike, allowing them to apply theoretical knowledge to real-world scenarios. This article will explore a variety of sample problems commonly encountered in mechanical engineering, including topics such as statics, dynamics, thermodynamics, fluid mechanics, and materials science. Each section will provide a sample problem, its solution, and an explanation of the underlying principles.

Statistical Mechanics

Problem 1: Equilibrium of Forces

A beam is supported at both ends and carries a uniform load of 2000 N over its length of 4 meters. Determine the reactions at the supports.

Solution:

1. Identify the forces:

- Uniform load (w) = 2000 N
- Length of beam (L) = 4 m

2. Calculate the total load:

- Total load (W) = $w \times L = 2000 \text{ N} \times 4 \text{ m} = 8000 \text{ N}$

3. Determine reactions at supports:

- Let (R_A) be the reaction at the left support and (R_B) be the reaction at the right support.
- The total vertical forces must balance:

$$R_A + R_B = W$$

$$R_A + R_B = 8000 \text{ N}$$

4. Taking moments about point A:

- Moment due to the uniform load acts at the center of the beam (2 m from A):

$$\text{Moment} = W \times \text{distance from A} = 8000 \text{ N} \times 2 \text{ m} = 16000 \text{ Nm}$$

- The moment at point B must be equal to this:

$$R_B \times 4 = 16000$$

$$R_B = \frac{16000}{4} = 4000 \text{ N}$$

5. Substituting back to find (R_A) :

$$R_A + 4000 = 8000$$

$$R_A = 8000 - 4000 = 4000 \text{ N}$$

Conclusion: The reactions at the supports are $(R_A = 4000 \text{ N})$ and

$(R_B = 4000 \text{ N})$.

Dynamics

Problem 2: Motion of a Projectile

A projectile is launched from the ground with an initial velocity of 30 m/s at an angle of 45° to the horizontal. Calculate the maximum height reached by the projectile.

Solution:

1. Resolve the initial velocity into components:

$$V_{0x} = V_0 \cdot \cos(\theta) = 30 \cdot \cos(45^\circ) = 30 \cdot \frac{\sqrt{2}}{2} \approx 21.21 \text{ m/s}$$

$$V_{0y} = V_0 \cdot \sin(\theta) = 30 \cdot \sin(45^\circ) = 30 \cdot \frac{\sqrt{2}}{2} \approx 21.21 \text{ m/s}$$

2. Use the formula for maximum height:

$$H = \frac{V_{0y}^2}{2g}$$

where $(g = 9.81 \text{ m/s}^2)$ (acceleration due to gravity).

3. Calculate the maximum height:

$$H = \frac{(21.21)^2}{2 \cdot 9.81} \approx \frac{450.5041}{19.62} \approx 22.96 \text{ m}$$

Conclusion: The maximum height reached by the projectile is approximately 22.96 meters.

Thermodynamics

Problem 3: Heat Transfer

A metal rod with a length of 1 meter and a cross-sectional area of 0.01 m^2 experiences a temperature difference of 100°C between its ends. If the thermal conductivity of the metal is $50 \text{ W/m}\cdot\text{K}$, calculate the rate of heat transfer through the rod.

Solution:

1. Use Fourier's law of heat conduction:

$$Q = k \cdot A \cdot \frac{\Delta T}{L}$$

\]

where:

- \((Q) = \text{heat transfer rate (W)}
- \((k) = \text{thermal conductivity (W/m}\cdot\text{K)}
- \((A) = \text{cross-sectional area (m}^2\text{)}
- \((\Delta T) = \text{temperature difference (K)}
- \((L) = \text{length of the rod (m)}

2. Substituting the values:

\[

$$Q = 50 \cdot 0.01 \cdot \frac{100}{1} = 50 \cdot 0.01 \cdot 100 = 50 \text{ W}$$

\]

Conclusion: The rate of heat transfer through the rod is 50 Watts.

Fluid Mechanics

Problem 4: Bernoulli's Principle

A pipe with a diameter of 0.1 m narrows to a diameter of 0.05 m. Water flows through the pipe with a velocity of 3 m/s in the larger section. Calculate the velocity of the water in the narrower section.

Solution:

1. Using the continuity equation:

\[

$$A_1 V_1 = A_2 V_2$$

\]

where:

- \((A_1 = \pi \left(\frac{D_1}{2} \right)^2)
- \((A_2 = \pi \left(\frac{D_2}{2} \right)^2)

2. Calculate the areas:

- For \((D_1 = 0.1) \text{ m}:

\[

$$A_1 = \pi \left(\frac{0.1}{2} \right)^2 = \pi \left(0.05 \right)^2 \approx 0.00785 \text{ m}^2$$

\]

- For \((D_2 = 0.05) \text{ m}:

\[

$$A_2 = \pi \left(\frac{0.05}{2} \right)^2 = \pi \left(0.025 \right)^2 \approx 0.00196 \text{ m}^2$$

\]

3. Substituting into the continuity equation:

\[

$$0.00785 \cdot 3 = 0.00196 \cdot V_2$$

$$V_2 = \frac{0.00785 \cdot 3}{0.00196} \approx 12.0 \text{ m/s}$$

Conclusion: The velocity of the water in the narrower section of the pipe is approximately 12.0 m/s.

Materials Science

Problem 5: Stress and Strain

A steel rod with a diameter of 0.02 m and a length of 2 m is subjected to a tensile load of 50 kN. Calculate the stress and strain in the rod, given that the Young's modulus of steel is 200 GPa.

Solution:

1. Calculate the cross-sectional area:

$$A = \pi \left(\frac{d}{2} \right)^2 = \pi \left(\frac{0.02}{2} \right)^2 \approx 3.14 \times 10^{-4} \text{ m}^2$$

2. Calculate the stress:

$$\sigma = \frac{F}{A} = \frac{50000}{3.14 \times 10^{-4}} \approx 159.15 \text{ MPa}$$

3. Calculate the strain:

$$\epsilon = \frac{\sigma}{E} = \frac{159.15 \times 10^6}{200 \times 10^9} \approx 0.000796$$

Conclusion: The stress in the rod is approximately 159.15 MPa, and the strain is approximately 0.000796.

Conclusion

The sample problems presented in this article demonstrate the application of fundamental concepts in mechanical engineering across diverse topics such as statics, dynamics, thermodynamics, fluid mechanics, and materials science. By solving these problems, students and professionals can deepen their understanding and enhance their problem-solving skills, making them better equipped to tackle real-world engineering challenges.

Frequently Asked Questions

What are some common sample problems in mechanical engineering related to fluid mechanics?

Common sample problems in fluid mechanics include calculating the flow rate through a pipe, determining the pressure drop in a fluid system, analyzing laminar versus turbulent flow, and solving for forces on submerged surfaces using Bernoulli's equation.

How can I approach sample problems involving thermodynamics in mechanical engineering?

To approach thermodynamics sample problems, start by identifying the system and surroundings. Use the first and second laws of thermodynamics to set up equations. Apply relevant equations such as the ideal gas law, and consider processes like isobaric, isochoric, and adiabatic transformations.

What types of sample problems can help with understanding material strength in mechanical engineering?

Sample problems on material strength often involve calculating stress and strain, determining the factor of safety, analyzing tensile and compressive forces, and evaluating fatigue life using S-N curves. These problems help understand how materials behave under different loading conditions.

Can you provide an example of a mechanical engineering sample problem related to dynamics?

An example problem in dynamics could involve calculating the acceleration of a block sliding down an inclined plane. You would set up the equations of motion considering gravitational forces, friction, and normal force, and then solve for acceleration using Newton's second law.

What resources are available for practicing mechanical engineering sample problems effectively?

Resources for practicing mechanical engineering sample problems include textbooks with end-of-chapter problems, online platforms like Khan Academy and Coursera, engineering websites that offer problem sets, and forums like Reddit and Stack Exchange where students share and solve problems collaboratively.
