NCCPA PANCE Practice Exam 2 Questions and Answers.

A 27-year-old woman complains of years of menstrual irregularity and increasing facial and chest hair. PMH: significant for ovarian cyst and left cytectomy. She is a non-smoker and non-drinker. Labs include a negative uCG, elevated LH, and low FSH. She desires fertility and she has not responded to three cycles of clomiphene. What would be the next choice of medication that may return ovulation?

- A. Insulin
- B. Metformin
- C. Dexamethasone
- D. Spironalactone
- E. Finasteride -

The answer is B.

EXPLANATION: Dexamethasone, finasteride, and spironalactone all treat symptoms of hirsutism, but do not treat the underlying cause of PCO or improve fertility outcomes. PCO has an underlying insulin resistance that can be treated with oral hypoglycemics and improve sensitivity to insulin. Adding insulin does not improve the resistance.

A 2-week-old male infant presents for a routine checkup. The mother complains that he nurses every hour, but vomits (nonbilious) after every time he eats. He has only had three bowel movements since he has been home. On examination, the infant has not gained any weight since leaving the hospital, and the clinician notes gastric peristaltic waves. Which of the following is the treatment of choice for this patient?

- A. pyloromyotomy
- B. metoclopramide
- C. laparotomy
- D. omeprazole -

The answer is A.

EXPLANATION: This infant is presenting with signs and symptoms of pyloric stenosis. Infants typically have vomiting (projectile at times) after every feeding and it normally starts between the age of 2 and 4 weeks. The infant nurses fervently and is hungry. In addition, there may be dehydration, constipation, weight loss, and apathy. Abdomen may be distended with gastric peristaltic waves. Occasionally, an olive-sized mass can be felt in the right upper quadrant with deep palpation after the child has vomited. Vomitus is typically nonbilious. Diagnosis is confirmed by an upper gastrointestinal series with delayed gastric emptying, enlarged pyloric muscle, and characteristic semilunar impressions on the gastric antrum. In addition, an ultrasound is needed to verify the hypertrophic muscle. The treatment of choice for these patients is pyloromyotomy, which can be done laparoscopically. These patients make full recoveries and have an excellent prognosis.

Upon performing a newborn examination, the clinician notes a widened pulse pressure, paradoxical splitting of S2, and a "machine"-like murmur heard best at the second
