4. Building a Reservoir Model

Creating a reservoir model in Eclipse 100 involves several critical steps,

which are outlined in detail in the Schlumberger Eclipse 100 Users Manual.

4.1 Defining the Geological Model

The geological model forms the foundation of the reservoir simulation. Key steps include:

- Grid Definition: Create a 3D grid that represents the reservoir's physical dimensions, including cell sizes and shapes.
- Property Assignment: Assign reservoir properties (e.g., porosity, permeability) to each grid cell based on geological data.

4.2 Setting Up Fluid Properties

Fluid properties play a crucial role in simulation accuracy. Consider the following:

- Define Fluid Types: Specify the types of fluids present in the reservoir (e.g., oil, gas, water).
- Input PVT Data: Enter pressure-volume-temperature (PVT) data for the fluids to accurately model their behavior under different conditions.

5. Running Simulations

Once the reservoir model is built, users can run simulations to analyze reservoir performance.

5.1 Configuring Simulation Parameters

Before running a simulation, configure the following parameters:

- Simulation Time: Set the duration of the simulation and the time steps.
- Solver Settings: Choose the solver type based on the complexity of the model.
- Output Options: Specify what type of output data will be generated (e.g., production rates, pressure changes).

5.2 Executing the Simulation

To execute the simulation:

1. Click on the Run Button: In the simulation menu, select the 'Run' option.
2. Monitor Progress: Use the progress bar to track the simulation's status.

5.3 Analyzing Results

After the simulation completes, users can analyze results using built-in visualization tools. Key aspects to focus on include:
