Python 3 Cheat Sheet

Latest version on : <https://perso.liait.fr/petalot/python/memoires/>

Base Types		Container Types	
integer, float, boolean, string, bytes		list [1,5,9] ["x",11,8.9] [“not”]	[]
int 783 0 -192 0b010 0o642 0xF3 float 9.23 0.0 -1.7e-6	binary octal hexa	tuple (1,5,9) 11, "y", 7.4 ("not",)	()
bool True False	x10	Non-modifiable values (immutable) 2 expression with only constants → tuple	
str "One\nTwo"	Multiline string escaped new line '\\n' escaped tab	"X(Y)z" 1\2\3" "	b" "
bytes b'toto\xfe\x7f\x75'	hexadecimal octal	key containers, no a priori order, fast key access, each key is unique	
	2 immutables	dictionary dict {"key": "value"} dict(a=3,b=4,c="v") (key-value associations) {1:"one", 3:"three", 2:"two", 3.14:"pi"} collection set ("key1", "key2") {(1, 9, 3, 0)} 2 keys=values values (base types, immutables...) frozenset immutable set ()	empty
Identifiers		Conversions	
for variable, function, module, class... name a-zA-Z followed by a-zA-Z_0-9 ○ dictionaries allowed but should be avoided ○ language keywords forbidden ○ lower/UPPER case discrimination ○ a tota x7 y_max bigone ○ by and by		int("15") → 15 int("3f", 16) → 63 can specify integer number base in 2 nd parameter int(15.56) → 15 truncate decimal part float("-11.24e8") → -1124000000.0 round(15.56, 1) → 15.6 rounding to 1 decimal (0 decimal → integer number) bool(x) False for null x, empty container x, None or False x; True for other x str(x) "..." representation string of x for display (cf. formatting on the back) chr(64) "B" ord('B') → 66 code ↔ char repr(x) "..." literal representation string of x bytes([72, 9, 64]) → b'HtB'	
= Variables assignment		list(["abc", "def", "ghi"]) → ['abc', 'def', 'ghi'] dict([(3, "three"), (1, "one")]) → {1: 'one', 3: 'three'} set(["one", "two"]) → {'one', 'two'} separat str and sequence of str → assembled str " ".join(['toto', '121', 'pwd']) → 'toto:121:pwd'	
Assignment → binding of a name with a value 1) evaluation of right side expression value 2) assignment in order with left side names x=1, 2+8+sin(y) a=b=c=0 assignment to same value y, z, r=9, 2, 6, 0 multiple assignments a, b=a values swap a, *bseq unpacking of sequence in *a, *bseq item and list x+=3 increment to xxx+3 x-=2 decrement to xxk-2 x=None undefined or constant value del x remove name x		str split on whitespaces → list of str "words with spaces".split() → ['words', 'with', 'spaces'] str split on separator str → list of str "1,4,8,2".split(",") → ['1', '4', '8', '2'] sequence of one type → list of another type (via list comprehension) [int(x) for x in ('1', '29', '-3')] → [1, 29, -3]	
Sequence Containers Indexing			
negative index -5 -4 -3 -2 -1 positive index 0 1 2 3 4 lst=[10, 20, 30, 40, 50] positive slice 0 1 2 3 4 5 negative slice -5 -4 -3 -2 -1	Items count len(lst) → 5 index from 0 (here from 0 to 4)	Individual access to items via list[index] lst[0] → 10 → first one lst[-1] → 50 → last one lst[-2] → 40 On mutable sequences (list), remove with del lst[3] and modify with assignment lst[4]=25	
Access to sub-sequences via list[start slice:end slice:step]		lst[:1]->[10, 20, 30, 40] lst[::-1]->[50, 40, 30, 20, 10] lst[1:-1]->[20, 30, 40] lst[1:3]->[20, 30] lst[3:]->[10, 20, 30] lst[1:-1]->[20, 30, 40] lst[::2]->[50, 30, 10] lst[-3:-1]->[30, 40] lst[3:]->[40, 50] lst[::2]->[10, 30, 50] lst[::]->[10, 20, 30, 40, 50] shallow copy of sequence	
Misusing slice indication → from start / up to end. On mutable sequences (list), remove with del lst[3:5] and modify with assignment lst[1:4]=[15, 25]			
Boolean Logic			
Comparisons: < <= > >= != == (boolean results) 5 ≥ 5 = = a and b logical and both simultaneously a or b logical or one or other or both Tip: and and or return value of a or b (order of evaluation). to ensure that a and b are booleans. not a logical not True False True and False constants		module true-or-false true.py from monmod import nom1,nom2 as fct → direct access to names, renaming with as import monmod → access via monmod.nom1 ... if modules and packages searched in python path (cf sys.path)	
Statements Blocks			
parent statement: statement block 1... ⋮ parent statement: statement block2... ⋮ next statement after block 1	Configure editor to insert 4 spaces in place of an indentation tab.	Statement block executed only if a condition is true if logical condition: — statements block	Conditional Statement
floating numbers... approximated rather Operators + - * / // % ** Priority (...) * - + ! ! a ² Priority % integer % → remainder % → matrix X * pivot J-compy (1+5, 3)*2-12, 6 abs(-3, 2)-3, 2 round(3, 5, 7)+3, 6 pow(4, 3)-64, 0 if usual order of operations	angle in radians from math import sin, pi... sin(pi/4) → 0.707... cos(2*pi/3) → -0.4999... sqrt(81) → 9.0 log(e**2) → 2.0 ceil(12.5) → 13 floor(12.5) → 12 modules.math, statistics, random, decimal, fractions, numpy, etc (cf doc)	Can go with several elif, else, and only one final else. Only the block of first true condition is executed. with a var x: if bool(x)==True: ⇒ if x: if bool(x)==False: ⇒ if not x: if age<=18: state="Kid" elif age>65: state="Retired" else: state="Active"	
Exceptions on Errors			
		Signaling an error: raise EuError(...) Errors processing: try: — normal processing block except Exception as e: — error processing block	Exceptions on Errors
		normal processing block error processing block finally block for final processing in all cases	

SPSS syntax cheat sheet is an invaluable resource for anyone working with SPSS (Statistical Package for the Social Sciences), a powerful software used for statistical analysis. Whether you are a beginner or an experienced user, a cheat sheet can streamline your workflow and enhance your understanding of SPSS syntax. This article will provide a comprehensive overview of the essential commands, functions, and tips to effectively utilize SPSS syntax, allowing you to perform statistical analyses with greater efficiency and precision.

What is SPSS Syntax?

SPSS syntax is a command language that allows users to perform data manipulation, statistical analysis, and graphical representation in SPSS. Instead of using the graphical user interface (GUI), users can write scripts that can be executed in SPSS to perform various tasks. This method is particularly useful for:

- Reproducing analyses: Syntax allows users to save and rerun analyses without having to repeat manual steps.
- Batch processing: Users can apply the same commands to multiple datasets with minimal effort.
- Enhanced documentation: By writing syntax, users create a record of their analytical process, which can be beneficial for transparency and reproducibility.

Basic SPSS Syntax Structure

Understanding the basic structure of SPSS syntax is crucial for effective use. The syntax consists of commands, keywords, and options, which are written in a specific format. Here's a breakdown of the essential components:

1. Commands

Commands are the main instructions in SPSS syntax. They indicate the type of operation to be performed. Common commands include:

- **DATA LIST:** Used to define the structure of your dataset.
- **VARIABLE LABELS:** Assigns descriptive labels to variables.
- **FREQUENCIES:** Produces frequency tables for categorical variables.
- **DESCRIPTIVES:** Generates descriptive statistics.
- **REGRESSION:** Conducts regression analysis.

2. Keywords

Keywords modify commands and specify options. They often follow the command and can include parameters, variable names, and statistical options. For example:

```
```plaintext
FREQUENCIES VARIABLES=age gender.
````
```

In this command, `VARIABLES` is a keyword that specifies which variables to include in the frequency table.

3. Options

Options provide additional details on how commands should be executed. They can include statistical measures, output specifications, and conditions. For instance, in regression analysis, you might specify which statistics to report:

```
```plaintext
REGRESSION /STATISTICS COEFF OUTS RAN.
````
```

In this case, `/STATISTICS` is an option that alters the output of the regression command.

Essential SPSS Syntax Commands

Here's a collection of essential SPSS syntax commands that every user should know:

1. Data Management Commands

- DATA LIST: Define the variables and their formats.

```
```plaintext
DATA LIST LIST / id (F8) name (A20) age (F2).
````
```

- VARIABLE LABELS: Assign meaningful labels to variables.

```
```plaintext
VARIABLE LABELS age 'Age of Respondent' gender 'Gender of Respondent'.
````
```

- RECODE: Change the values of a variable.

```
```plaintext
RECODE age (1=0) (2=1) INTO age_group.
````
```

- COMPUTE: Create new variables based on calculations.

```plaintext

COMPUTE total\_score = score1 + score2 + score3.

```

2. Descriptive Statistics Commands

- DESCRIPTIVES: Generate summary statistics.

```plaintext

DESCRIPTIVES VARIABLES=age income /STATISTICS=MEAN STDDEV MIN MAX.

```

- FREQUENCIES: Display frequency distributions for categorical variables.

```plaintext

FREQUENCIES VARIABLES=gender marital\_status.

```

3. Inferential Statistics Commands

- T-TEST: Conduct t-tests to compare means.

```plaintext

T-TEST GROUPS=gender(1 2) /VARIABLES=score.

```

- ANOVA: Perform analysis of variance.

```plaintext

ONEWAY score BY group /STATISTICS DESCRIPTIVES.

```

- REGRESSION: Conduct linear regression analysis.

```plaintext

REGRESSION /DEPENDENT score /METHOD=ENTER age gender.

```

Working with SPSS Syntax: Tips and Best Practices

Using SPSS syntax effectively requires careful attention to detail and organization. Here are some best practices to enhance your experience:

1. Commenting Your Syntax

Use comments to annotate your code, making it easier to understand later. In SPSS, you can add comments using an asterisk (*) or by enclosing text in quotes. For example:

```
```plaintext
This command calculates the mean age of respondents.
DESCRIPTIVES VARIABLES=age.
````
```

2. Organizing Your Syntax

Keep your syntax organized by grouping related commands together. Use blank lines to separate sections for clarity. This practice will help you navigate and update your code more efficiently.

3. Saving and Reusing Syntax

Save your syntax files with a .sps extension. This allows you to easily open and modify your commands in the future. You can also copy and paste syntax from one file to another, enabling you to reuse code across different projects.

4. Utilizing Syntax Error Checking

SPSS provides a syntax editor that highlights errors in your code. Take advantage of this feature to debug your syntax before running it. Look for red underlines or error messages to identify and resolve issues.

Conclusion

A **SPSS syntax cheat sheet** is a powerful tool for enhancing your statistical analysis capabilities. Understanding the basic structure of syntax, familiarizing yourself with essential commands, and following best practices can significantly improve your efficiency and accuracy in SPSS. By mastering SPSS syntax, you can streamline your workflow, ensure reproducibility, and gain deeper insights from your data analysis efforts. Embrace the power of syntax and elevate your statistical analysis skills today!

Frequently Asked Questions

What is an SPSS syntax cheat sheet?

An SPSS syntax cheat sheet is a quick reference guide that provides commonly used SPSS commands and syntax structures, helping users to efficiently write and understand SPSS

code.

Where can I find a reliable SPSS syntax cheat sheet?

Reliable SPSS syntax cheat sheets can be found on academic websites, SPSS user forums, and resources provided by educational institutions, as well as in SPSS documentation.

What are some common commands included in an SPSS syntax cheat sheet?

Common commands include 'DATA LIST', 'VARIABLE LABELS', 'VALUE LABELS', 'FREQUENCIES', 'DESCRIPTIVES', and commands for transforming data such as 'RECODE' and 'COMPUTE'.

How can using an SPSS syntax cheat sheet improve my workflow?

Using a cheat sheet can speed up the coding process, reduce errors, and enhance reproducibility by providing quick access to key commands without having to search through documentation.

Is it necessary to learn SPSS syntax if I am using the graphical interface?

While it's not necessary, learning SPSS syntax can enhance your capabilities, allowing for more complex analyses, batch processing, and better documentation of your work.

Can I customize my own SPSS syntax cheat sheet?

Yes, you can customize your own SPSS syntax cheat sheet by including commands and syntax that are particularly useful for your specific analyses or projects.
