Properties of Logarithms

Properties of Logarithms Properties of logarithms can be used to derive the following properties of logarithms.

Product Property of Logarithms	If M and N are positive real numbers and a is a positive real number, then $\log_a(MN) = \log_a M + \log_a N$.
Quotient Property of Logarithms	If M and N are positive real numbers and a is a positive real number, then $\log_a\left(\frac{M}{N}\right) = \log_a M - \log_a N$.
Power Property of Logarithms	If M is a positive real number, a is a positive real number, and p is any real number, then $\log_a(M^p) = p \log_a M$.

Example: Use $\log_2 36 = 5.1761$ and $\log_2 7 = 2.8074$ to approximate the value of each expression.

a. $\log_2 252$	b. $\log_2 5$	c. $\log_2 840$
$\log_2 252 = \log_2 (2 \cdot 126) = \log_2 2 + \log_2 126$ $= 1 + \log_2 126$ $= 1 + \log_2 (2 \cdot 63) = 1 + 1 + \log_2 63$ $= 2 + \log_2 63$ $= 2 + \log_2 (7 \cdot 9) = 2 + \log_2 7 + \log_2 9$ $= 2 + 2.8074 + \log_2 9$ $= 4.8074 + \log_2 9$ $\approx 4.8074 + 3.1699$ ≈ 7.9773	$\log_2 5 = \log_2 \left(\frac{36}{7}\right) = \log_2 36 - \log_2 7$ $= 5.1761 - 2.8074$ $= 2.3687$	$\log_2 840 = \log_2 (2 \cdot 420) = \log_2 2 + \log_2 420$ $= 1 + \log_2 420$ $= 1 + \log_2 (2 \cdot 210) = 1 + 1 + \log_2 210$ $= 2 + \log_2 210$ $= 2 + \log_2 (2 \cdot 105) = 2 + 1 + \log_2 105$ $= 3 + \log_2 105$ $= 3 + \log_2 (3 \cdot 35) = 3 + \log_2 3 + \log_2 35$ $= 3 + 1.5850 + \log_2 35$ $= 4.5850 + \log_2 35$ $= 4.5850 + \log_2 (5 \cdot 7) = 4.5850 + \log_2 5 + \log_2 7$ $= 4.5850 + 2.3687 + 2.8074$ $= 9.7611$

Answer:

d. $\log_2 18 \approx 4.1700$ and e. $\log_2 63 \approx 5.9773$ f. $\log_2 420 \approx 8.7611$

d. $\log_2 18$	e. $\log_2 63$	f. $\log_2 420$
$\log_2 18 = \log_2 (2 \cdot 9) = \log_2 2 + \log_2 9$ $= 1 + \log_2 9$ $= 1 + \log_2 (3 \cdot 3) = 1 + \log_2 3 + \log_2 3$ $= 1 + 1.5850 + 1.5850$ $= 4.1700$	$\log_2 63 = \log_2 (7 \cdot 9) = \log_2 7 + \log_2 9$ $= 2.8074 + \log_2 9$ $= 2.8074 + 3.1699$ $= 5.9773$	$\log_2 420 = \log_2 (2 \cdot 210) = \log_2 2 + \log_2 210$ $= 1 + \log_2 210$ $= 1 + \log_2 (2 \cdot 105) = 1 + 1 + \log_2 105$ $= 2 + \log_2 105$ $= 2 + \log_2 (3 \cdot 35) = 2 + \log_2 3 + \log_2 35$ $= 2 + 1.5850 + \log_2 35$ $= 3.5850 + \log_2 35$ $= 3.5850 + \log_2 (5 \cdot 7) = 3.5850 + \log_2 5 + \log_2 7$ $= 3.5850 + 2.3687 + 2.8074$ $= 8.7611$

Example: Use $\log_2 36 = 5.1761$ and $\log_2 7 = 2.8074$ to approximate the value of each expression.

g. $\log_2 10$	h. $\log_2 105$	i. $\log_2 100$
$\log_2 10 = \log_2 (2 \cdot 5) = \log_2 2 + \log_2 5$ $= 1 + \log_2 5$ $= 1 + 2.3687$ $= 3.3687$	$\log_2 105 = \log_2 (3 \cdot 5 \cdot 7) = \log_2 3 + \log_2 5 + \log_2 7$ $= 1.5850 + 2.3687 + 2.8074$ $= 6.7611$	$\log_2 100 = \log_2 (2 \cdot 50) = \log_2 2 + \log_2 50$ $= 1 + \log_2 50$ $= 1 + \log_2 (2 \cdot 25) = 1 + 1 + \log_2 25$ $= 2 + \log_2 25$ $= 2 + \log_2 (5 \cdot 5) = 2 + \log_2 5 + \log_2 5$ $= 2 + 2.3687 + 2.3687$ $= 6.7374$

Study Guide and Intervention Common Logarithms Answers

Logarithms play a pivotal role in mathematics, particularly in algebra and calculus. They provide a way to express exponential relationships and are crucial in various scientific fields. A common logarithm, specifically, is a logarithm with base 10. Understanding how to work with common logarithms is essential for solving equations and understanding mathematical concepts. This article serves as a comprehensive study guide and intervention resource, providing explanations, examples, and answers to common logarithmic problems.

Understanding Common Logarithms

Common logarithms are denoted as $\log(x)$ or $\log_{10}(x)$ and are used to determine the power to which the base 10 must be raised to obtain a given number. For instance, if $\log_{10}(100) = 2$, it means that 10 raised to the power of 2 equals 100.

Properties of Common Logarithms

To effectively work with common logarithms, it's important to understand their properties. Here are some key properties:

- Product Property:
 - $\log_{10}(a \cdot b) = \log_{10}(a) + \log_{10}(b)$
 - This property states that the logarithm of a product is the sum of the logarithms.
- Quotient Property:
 - $\log_{10}\left(\frac{a}{b}\right) = \log_{10}(a) - \log_{10}(b)$

- This indicates that the logarithm of a quotient is the difference of the logarithms.

3. Power Property:

- $\log_{10}(a^b) = b \log_{10}(a)$

- This property showcases how to handle exponents within logarithms.

4. Logarithm of 1:

- $\log_{10}(1) = 0$

- Since any number raised to the power of 0 equals 1.

5. Logarithm of the Base:

- $\log_{10}(10) = 1$

- This states that the logarithm of the base itself equals 1.

Solving Common Logarithmic Equations

To solve equations involving common logarithms, you often need to apply the properties mentioned above. Below are typical steps involved in solving common logarithmic equations:

1. Isolate the logarithm: If possible, get the logarithmic expression by itself on one side of the equation.
2. Convert to exponential form: Use the definition of a logarithm to rewrite the equation in exponential form.
3. Solve the resulting equation: This may involve algebraic manipulation or further simplification.
4. Check your solutions: Always substitute back into the original equation to verify that your solutions are valid.

Example Problems

Let's look at some example problems to illustrate these concepts.

Example 1: Solve the equation $\log_{10}(x) = 2$.

- Step 1: Rewrite in exponential form: $x = 10^2$.
- Step 2: Calculate: $x = 100$.
- Solution: $x = 100$.

Example 2: Solve $\log_{10}(x) + \log_{10}(5) = 3$.

- Step 1: Use the product property: $\log_{10}(5x) = 3$.
- Step 2: Convert to exponential form: $5x = 10^3$.
- Step 3: Solve for x: $5x = 1000$, so $x = 1000 / 5 = 200$.

- Solution: $x = 200$.

Example 3: Solve $\log_{10}(x - 1) = 1$.

- Step 1: Rewrite in exponential form: $x - 1 = 10^1$.
- Step 2: Calculate: $x - 1 = 10$, so $x = 11$.
- Solution: $x = 11$.

Common Logarithmic Functions

The common logarithmic function, $y = \log_{10}(x)$, is essential for graphing and understanding transformations. Its key features include:

- Domain: $x > 0$ (logarithms are undefined for zero and negative values).
- Range: All real numbers $(-\infty, \infty)$.
- Intercept: The graph crosses the y-axis at $(1, 0)$.
- Asymptote: The vertical line $x = 0$ is a vertical asymptote.

Graphing Common Logarithms

When graphing $y = \log_{10}(x)$, consider the following points:

- When $x = 1$, $y = 0$.
- When $x = 10$, $y = 1$.
- When $x = 100$, $y = 2$.
- As x approaches 0 from the right, y approaches $-\infty$.

The resulting graph will increase slowly and never touch the y-axis, demonstrating the logarithmic growth pattern.

Applications of Common Logarithms

Common logarithms have numerous applications across various fields:

1. Science and Engineering: Used in measurements such as pH levels in chemistry and decibel levels in acoustics.
2. Finance: Employed for calculating compound interest over time, which often involves exponential functions.
3. Statistics: Used in data analysis and modeling, particularly in regression equations involving exponential growth.

Practice Problems

To reinforce your understanding, here are some practice problems:

1. Solve for x : $\log_{10}(3x) = 2$.
2. Simplify: $\log_{10}(1000) - \log_{10}(10)$.
3. Solve: $2 \log_{10}(x) = 4$.

Answers:

1. $x = 100/3$.
2. $\log_{10}(100) = 2$.
3. $x = 100$.

Study Tips for Mastering Common Logarithms

Here are some effective study strategies to help you master common logarithmic concepts:

- Practice Regularly: Consistent practice with various problems solidifies understanding.
- Utilize Graphs: Visualizing logarithmic functions can enhance comprehension of their behavior.
- Group Study: Collaborating with peers can provide new insights and explanations.
- Seek Help When Needed: Don't hesitate to ask teachers or tutors for clarification on difficult concepts.

Conclusion

Understanding common logarithms is essential for success in algebra and higher-level mathematics. By mastering the properties, solving techniques, and applications of logarithms, students can enhance their mathematical skills and apply these concepts in real-world scenarios. Regular practice and utilization of study resources will further reinforce this knowledge, leading to greater confidence and proficiency in mathematics.

Frequently Asked Questions

What are common logarithms and how are they used in mathematics?

Common logarithms are logarithms with a base of 10. They are used to simplify calculations involving exponential functions and to solve equations where the variable is an exponent.

Where can I find answers for the Study Guide and Intervention for common logarithms?

Answers for the Study Guide and Intervention for common logarithms can typically be found in the back of the textbook, on the publisher's website, or through educational resources like tutoring centers and online homework help platforms.

How do I solve equations involving common logarithms?

To solve equations involving common logarithms, you can use the properties of logarithms, such as the fact that if $\log_{10}(x) = y$, then $10^y = x$. This allows you to rewrite the logarithmic equation as an exponential equation.

What are some common properties of logarithms that I should know?

Key properties of logarithms include the product property ($\log_{10}(a \cdot b) = \log_{10}(a) + \log_{10}(b)$), the quotient property ($\log_{10}(a / b) = \log_{10}(a) - \log_{10}(b)$), and the power property ($\log_{10}(a^b) = b \log_{10}(a)$).

Can I use a calculator to find common logarithms, and if so, how?

Yes, most scientific calculators have a 'log' button that calculates common logarithms. Simply input the number you want to find the logarithm of and press the 'log' button to get the answer.

What types of problems are typically included in a Study Guide and Intervention for common logarithms?

Typical problems include evaluating logarithms, solving logarithmic equations, applying logarithmic properties to simplify expressions, and real-world applications like calculating pH levels or decibel levels.
