## Frequently Asked Questions

### What are the key differences between cash basis and accrual basis accounting?

Cash basis accounting records revenues and expenses when cash is actually received or paid, while accrual basis accounting recognizes revenues and expenses when they are incurred, regardless of cash flow. This means that accrual accounting provides a more accurate picture of a company's financial position.

### How do you calculate the break-even point in accounting?

The break-even point is calculated by dividing total fixed costs by the contribution margin per unit (selling price per unit minus variable cost per unit). This shows the number of units that must be sold to cover all costs.

### What is the purpose of a trial balance in accounting?

A trial balance is used to ensure that the total debits equal total credits in the double-entry accounting system. It helps identify any discrepancies before preparing financial statements.

### Can you explain the concept of depreciation and its methods?

Depreciation is the process of allocating the cost of a tangible asset over its useful life. Common methods include straight-line depreciation, which spreads the cost evenly over the asset's life, and declining balance depreciation, which accelerates the expense in the earlier years.

# What is the significance of the accounting equation?

The accounting equation,  $\text{Assets} = \text{Liabilities} + \text{Equity}$ , is fundamental to double-entry accounting. It ensures that a company's balance sheet is balanced and reflects the relationship between what a company owns, owes, and the residual interest of the owners.
