 - Cas9: an enzyme that creates double-strand breaks in DNA.
- Process:
 - Design gRNA to target a specific gene.
 - Introduce the gRNA and Cas9 into the cell.
 - Allow the cell to repair the break, leading to gene edits.

4.2 Gene Cloning

Gene cloning involves creating copies of a specific gene by inserting it into a plasmid vector and introducing it into host cells, typically bacteria.

- Steps:
- Isolate the gene of interest.
- Insert the gene into a plasmid using restriction enzymes and ligase.
- Transform competent bacterial cells with the plasmid.

4.3 Transgenic Organism Creation

Transgenic organisms are created by introducing foreign DNA into their genomes, allowing for the study of gene function and the production of recombinant proteins.
