If your Wolf gas oven is not heating properly, consider the following steps:

- Check the Gas Supply: Ensure that the gas supply to the oven is turned on. Check the gas line for any kinks or blockages.
- Inspect the Igniter: The igniter may be faulty. If it glows but does not ignite the gas, it likely needs replacement.
- 3. Examine the Control Settings: Confirm that the oven is set to the correct mode (bake, broil, etc.) and that the temperature is properly set.

 Inspect the Oven Seal: A damaged door seal can cause heat loss. Inspect and replace the seal if necessary.
3. Ignition Issues
If your oven is having trouble igniting, follow these steps:
 Check the Power Supply: Ensure that the oven is plugged in and that the circuit breaker has not tripped.
2. Inspect the Igniter: If the igniter is cracked or not glowing, it likely needs replacement.
