### ABSTRACT

Yahoo! Answers represents a new type of community portal that allows users to post questions and/or answer questions asked by other members of the community, already featuring a very large number of questions and several million users. Other recently launched services, like Microsoft's Live QnA and Amazon's Askville, follow the same basic interaction model. The popularity and the particular characteristics of this model call for a closer study that can help a deeper understanding of the entities involved, their interactions, and the implications of the model. Such understanding is a crucial step in social and algorithmic research that could yield improvements to various components of the service, for instance, personalizing the interaction with the system based on user interest. In this paper, we perform an analysis of 10 months worth of Yahoo! Answers data that provides insights into user behavior and impact as well as into various aspects of the service and its possible evolution.

### 1. INTRODUCTION

The last couple of years marked a rapid increase in the number of users on the internet and the average time spent online, along with the proliferation and improvement of the underlying communication technologies. These changes enabled the emergence of extremely popular web sites that support user communities centered on shared content. Typical examples of such community portals include multimedia sharing sites, such as Flickr or YouTube, social networking sites, such as Facebook or MySpace, social bookmarking sites, such as del.icio.us or StumbleUpon, and collaboratively built knowledge bases, such as Wikipedia. Yahoo! Answers [12], which was launched internationally at the end of 2005, represents a new type of community portal. It is "the place to ask questions and get real answers from real people,"<sup>1</sup> that is, a service that allows users to post questions and/or answer questions asked by other members of the community. In addition, Yahoo! Answers facilitates the preservation and retrieval of answered questions aimed at building an online knowledge base. The site is meant to encompass any topic, from travel and dining out to science and mathematics to parenting. Typical questions include:

- "If I send a CD using USPS media mail will the charge include a box or envelope to send the item?"
- "Has the PS3 lived up to the hype?"
- "Can anyone come up with a poem for me?"

Despite its relative novelty, Yahoo! Answers already featured more than 10 million questions and a community of several million users as of February 2007. In addition, other recently launched services, like Microsoft's Live QnA [8] and Amazon's Askville [2], seem to follow the same basic interaction model. The popularity and the particular characteristics of this model call for a closer study that can help a deeper understanding of the entities involved, such as users, questions, answers, their interactions, as well as the implications of this model. Such understanding is a crucial step in social and algorithmic research that could ultimately yield improvements to various components of the service, for instance, searching and ranking answered questions, measuring user reputation or personalizing the interaction with the system based on user interest.

In this paper, we perform an analysis of 10 months worth of Yahoo! Answers data focusing on the user base. We study several aspects of user behavior in a question answering system, such as activity levels, roles, interests, connectedness and reputation, and we discuss various aspects of the service and its possible evolution. We start with a historical background in question answering systems (Section 3) and proceed with a description of Yahoo! Answers (Section 4). We discuss a way of measuring user reputation based on the HITS randomized algorithm (Section 5) and we present our experimental findings (Section 6). On the basis of these results and anecdotal evidence, we propose possible research directions for the service's evolution (Section 7).

### 2. RELATED WORK

Whether it is by surfing the web, posting on blogs, searching in search engines, or participating in community portals, users leave their traces all over the web. Understanding user behavior is a crucial step in building more effective systems and this fact has motivated a large amount of user-centered research on different web-based systems [1, 3, 7, 10, 11, 13]. [13] analyses the topology of online forums used for seeking and sharing expertise and proposes algorithms for identifying potential expert users. [1] presents a large scale study correlating the behaviors of Internet users on multiple systems. [11] examines user trails in web searches. A number of studies focus on user tagging behavior in social systems,
